Each pump discharges at 95 pounds pressure into a 36 inch pipe, thence through a Venturi meter into a large 72 inch main. The contract for the building was recently let to the Atlas Construction Company of Montreal. Work is being started immediately and will be rushed to completion. The first pump will be operating in the new station in September 1922. Power is taken from the Montreal Light, Heat and Power Company which Company has transmission lines from Shawinigan Falls, Cedars Rapids, Soulanges, Chambly, and Lachine, all hydro electric power, and also from the steam driven plant at Ville La Salle.

IRON CASTINGS DECLARED SUCCESS

Demonstration Has Been Given—One Melting is Now Sufficient—Second Blast Furnace Soon to be in Operation

If the reports of the Ford interest are authentic, their new method of pouring iron castings is a decided success. A demonstration has already been given, and it is said that more than 75,000 cars have been built with castings made when the molten iron was poured direct from the River Rouge blast furnaces. Heretofore, castings had involved two meltings. The first, when the iron ore is converted into iron and the second when it is placed in the cupola furnace to be used for castings. In the Ford direct method the molten iron is drawn into caldrons having a capacity of 85 tons each. The caldrons are mounted on railway trucks and drawn to the foundry. The iron remains in a liquid state for 36 hours. Conveyor chains bring the molds past the pouring point and the iron is poured directly into the molds. Twenty conveyor lines are under construction.

The company now produces practically all the iron used on approximately 4,200 cars daily. A second blast furnace will soon be placed in operation A great deal of the work of the Highland Park foundries will then be transferred to River Rouge.

ARMSTRONG WHITWORTH OF CANADA LIMITED

298 St. James Street -- Montreal

LAURENTIDE MILL INSTALLS TWO NEW PAPER MAKING MACHINES

THE Laurentide Co. at Grand Mere, Que., have recently installed two new 166-in. news machines. This means that they will be able to produce marketable paper at the rate of at least 1,000 feet per minute. The machines have a daily capacity of 75 tons each, and were made in Canada. The Dominion Bridge Co. are doing the work under the supervision of George D Kilberry, chief engineer of the paper machinery department of the Dominion engineering works, and the preliminary designs were started in October 1919. It was found that the design work was handled more efficiently than had been even hoped for, with the result that Canadian labor completed the machines in splendid shape, in spite of the fact that America is said to have had more experience in this respect.

The new machines embody no new principles in paper making, but have some features not common to most machines, chiefly the method of putting on new wires; the application of suction couch and suction press rolls; a novel arrangement of compressed air jets for passing the tail or ribbon of paper from couch to press, and between the presses as well as at the calenders and reel, also the very generous use of ball bearing at the wet end of the machines.

Each machine has four presses with the first press of the Millspaugh suction roll type, and the other three of the standard construction with granite tone top rolls and rubber covered bottom rolls. Special provision is made on these presses for oiling journals of both press rolls, the bottom rolls having collar oiling bearings and the top rolls a special bath oiling arrangement formed by the peculiar construction of journal. The felt arrangement on all presses is very simple and each felt has only one loop. This is made possible by allowing the felts to pass down through the pit into the basement where the automatic take ups are located. The hand and automatic guides are located on machine sill plates and accessible to machine tenders. The press felt rolls are rubber covered and operate in self aligning grease lubricated bearings. All presses are forward presses, that is the paper passes straight through them to the dryers. Outside of the above there is nothing unusual in the construction of the press part, save that it is built rigid and of pleasing design.

The Dryer Portion

The dryer part of each machine is composed of forty paper dryers 72-in. diameter, and one first dryer 36-in. diameter. The 72-in. dryers are arranged double deck style with the bottom dryers resting in bearings mounted directly on the sill plates. The top decks are arranged so that each dryer comes over space between two dryers, or what is called staggered formation, which is the usual construction. There are no felt dryers as the return felts are fully exposed to the drying effect of hot air. One top and one bottom felt are used for all dryers, necessitating all being reared together in one unit. Each felt is equipped with two long range automatic take ups, two hand guides, and two automatic guides. The felt rolls are made from 14-in. steel pipe and operate in ring oiling bearings with renewable linings.

The dryers are mounted in rigid bearings having babbitted linings. Each bearing has two oil rings made in halves easily removable, The dryer gearing is heavy and all gears machine cut with driving pistons of forged steel. The dryer shells are 1⅝-in. thick and bored on inside to make them of even wall thickness and remove all blisters from inside surface. This makes a better drying unit as well as eliminating the necessity of balance weights which are always a source of anxiety, especially when bolted in. The paper dryers are all equipped with bronze blade doctors with levers and weights for maintaining contact with dryers.

The paper is passed from dryer to dryer by means of the "Sheehan" paper carrier, which consists of a pair of endless ropes, running side by side on sheaves bolted to front end of dryer shells and almost equal in diameter to the dryers. The ropes part company at the last top dryer thereby letting go of the paper tail and returning over suitable sheaves to first dryer, where they join company again, and are ready to have the tail of paper thrown by hand into bite when required to thread paper through dryers from presses. This system works very well here and the Laurentide Company have all of their machines equipped with a similar carrier.

A novel arrangement is used to pass the paper to the calenders from the last top dryer, when threading paper through machine. It is accomplished by means of a series of air jets that blow the sheet which is about 10-in. to 12-in. wide from the doctor on last top dryer to the desired nip on calenders by means of guiding guards, so located that the sheet is blown between them to the nip. Should a break occur between dryers and calenders, a second novel device is used to pass the full width of sheet through calenders. This works along the lines of the squirt for cutting sheet at suction boxes on fourdrinier part, with the difference that a needle coming in contact with dryer is used instead of jet of water as at the fourdrinier part.

The needle arrangement consists of a piece of ⅜-in. round steel ground to a tapering point and carried in a frame in such a manner that it can be tilted away from face of dryer when not in use and at the same time travel across face of dryer to cut the sheet, when a break occurs at stack. This arrangement makes the passing of paper at stack a very simple matter, whereas without it, it would necessitate considerable skill on the part of the operatives to get the paper through and then only with considerable loss of paper at this point.

Without entering into further detail, it might be well to state that these machines were erected in the mill without the use of shims anywhere in their makeup. This speaks volumes for the class of work, for had the alignment been out, shims would have become an absolute necessity. Canadian mechanics are to be complimented on the successful conclusion of this work, also Mr. Kilberry who made its success possible.

CANADA'S TRADE SHOWS BIG DECREASE

Merchandise Exported Drops More Than 50 per Cent

A sharp decline in Canadian trade for the month of August, 1921, as compared with August, 1920, was recorded in the summary of Canadian trade just issued by the Department of Customs. Total Canadian trade for August, 1921, amounted to $127,510,299, as compared with $238,085,409 for August 1920. For the five months of the fiscal year closing with the end of August total trade was: 1921, $602,315,038; 1920, $1,063,358,170, a reduction of $461,038,132.

During August, 1921, imports entered for home consumption had a total value of $65,147,301, as compared with $124,318,014, a reduction of $59,170,713. For the five months ending August 31, the total merchandise entered for consumption was valued at $319,009,763, as compared with $597.890.603 in 1920. In August, 1920, domestic merchandise exported had a total value of $112,278,064, as compared with $61,485,993 for August, 1921.

Shows Heavy Decrease

In the five-months' period ending August 31 this year the total value of merchandise exported was $227,413,949, as compared with $454,390,487. Foreign merchandise exported in August, 1921 was valued at $877,005, as compared with $1,489,331. In the five-month's period ending August 31 this year the total foreign merchandise exported was valued at $5,891,326, as against $11,072,080 for 1920.

One of the most pronounced decrease was recorded in the fibre and textile business. In August, 1920, importations of these products totalled $28,590,352, as compared with $12,659,038 in August, 1921. Exports of these products, both domestic and foreign in August, 1920, totalled $1,598,716, as against 0381,098 in August, 1921. A considerable drop was also registered in the importation of mineral products. In August, 1920, the value of mineral importations was $22,779,680, as against $1,540,173 for August of this year. Exports of minerals and their products for August, 1920, had a value of $5,832,7[illegible] as against $2,418,231 for August, 19[illegible]

Trade Gossip

The Fort William Car and Foundry Co. are to get an order for repairing 1500 Government cars, according to Dr. R. J. Manion, M. P.

Toronto—John McLean, Danforth Ave. contemplates the erection of various stores and apartments, these to cost around $20,000.

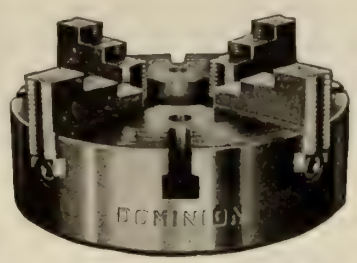
Woodstock, Ont.—John Morrison, clerk, will receive tenders until Sept. 12th for the construction of steel truss bridge. Alternative tenders being received for construction of earth filled reinforced concrete arch. Plans with F. J. Ure & Son, Engrs.

Toronto—Contracts have been awarded for two stores and apts. for W. T. Liddell, 113 Rusholme Rd. These are as follows:—Electrical, W. Whittaker, 2½ Bellwoods Park; plumbing, E, Emmott, 51 Amorth Ave.; plastering, G. Warren, 65 Fern Ave.; painting, W. Crook, 32 Wilshire Ave.

Roofing and sheet metal contracts have been issued for alterations to building for offices, automobile sales room and garage for Superior Realty Co., care of Wood, Fleming & Co., Royal Bank Bldg., are placed with Carmichael Waterproofing Co., Ltd., 918 Palmerston Ave.

An arena costing $20,000 will be erected at Milton, Ont., for the Milton Arena Ltd. The steel contract has been placed with Dominion Bridge Co., and the general contract for construction has been awarded to T. F. Norman 24 Blandford Avenue Toronto.

A new company, in Montreal, is arranging to erect 1,700 new homes by a special financial scheme. The houses are expected to cost $6,000 and easy payments will be available, these going as low as $10 per week.



Mr. Lucien Besnard, a representative of Schneider and Co. France, is in Montreal. The firm which he represents is owner of the Creusot iron and steel works. Mr. Besnard, who was formerly a member of the staff of the French High Commision in New York, and is now connected with office which the Schneiders opened in New York during the war, is in Canada for the purpose of ascertaining what market exists here for pig iron and fabricated steel from France. During his stay in Montreal he will confer with various trade bodies and will interview representative steel manufacturers and building contractors. He is registered at the Windsor Hotel.

The Eastern Equipment Co., Montreal have opened up a new office and show room at 234 Beaver Hall Hill. They intend keeping a full line of contractor's equipment as manufactured by St. Clair Bros. Galt, Ont., and they also represent the Koehring Co., of Milwaukee Wis. In the basement they have a portable Elliott wood worker connected, where an exhibition of the various operations of this machine is given to prospective purchasers. In addition to this exhibit at the office and wareroom, the company have a yard at Dorval where the largest part of their stock is kept.

Toronto—Tenders for the construction of the new east-end branch Technical High School, totalling $771,593, were approved at yesterday's meeting of the advisory industrial committee of the board of education. This figure marks a reduction of twenty-five thousand dollars on the total of the tenders rejected earlier in the Summer. A bulk tender of $607,192 was awarded to Witchell and Sons for twelve trades including masonry, stone, steel, carpentry, roofing, plastering, etc. Plumbing, heating, heat regulation and refrigeration were lumped, being allotted to W. G. Edge Company for $117,000. The next lowest figure for the whole building made up of tenders on individual trades, totalled $780,165. The new school will have a front center section of three storeys, with a wing one storey high to the rear. It will be of fireproof construction throughout and will accommodate approximately 1,000 day pupils and 2,500 night pupils.

* * *

Employees of General Motors in Oshawa now number about 1,350. There is not much likelihood that this will be increased in the immediate future, but hopes are entertained that the working force will be enlarged within a few months.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

Hand Screw Machines

30—No. 1 1/2 Star G.F.H., 1 1-2″ Cap., Power Feed Turret, oil pan and pump.
6 No. 3 Superior, Plain Head, 1 1-4″ Cap., oil pan and pump.
1—No. 4 Warner & Swasey, G.F.H., 1 1-2″ cap., Power Feed Turret oil pan and pump.
6—No. 4 Smurr & Kamer, G.F.H., 1 5-8″ cap., Power Feed Turret, oil pan and pump.
2—No. 4 Millholland, G.F.H., 1 1-2″ cap., Power Feed Turret, oil pan and pump.
11—No. 2 Smurr & Kamer, Plain Head, 1 1-16″ cap., oil pan and pump.
8—No. 2—Warner & Swasey, Plain Head, 1″ cap., oil pan and pump.
4—1 3-4″ x 7″ Gridley Multiple Spindle Automatics.
7—2 1/4 x 7″ Gridley Multiple Spindle Automatics.
8—3 1-4″ Gridley Single Spindle Automatics.
7—No. 55 Acme Automatic, Multiple Spindle.
12—No. 56 Acme Automatics, Multiple Spindle.

Shapers.

2—20″ Smith & Mills, B. G., Crank Shapers.
1—20″ Gould & Eberhardt Crank Shapers.

Milling Machines.

1—No. 3 Ford Smith Universal.
1—No. 2 Kempsmith Universal.
2—No. 3 Cincinnati Plain.
1—No. 2 Ford Smith Plain.
9 No. 1 Burke Bench Millers.

Drilling Machines.

2—Alfred Herbert 7″ overhang, ball bearing.
3—No. 1-2 Avey, Pedestal.
2—No. 1-2 Avey, Bench.
1—Leland Gifford, 6″ overhang, ball bearing, pedestal type.
1—Sipp, ball bearing, pedestal type, swing 16″.
4—Leland Gifford, 6″ overhang, ball bearing, bench type.
6—1-4 Rickert & Shafer, vertical tappers on pedestal.
1—5/8″ Rickert & Shafer, horizontal tappers on pedestal.
1—No. 1 1-2 Cincinnati.

Tool & Cutter Grinders.

1—No. 1 Norton.
1—Greenfield.
6—Stevens.
1—No. 2 Brown & Sharpe Surface Grinder.

Miscellaneous.

1—14 x 9 x 12 Can. Ingersoll Rand Belt Driven Air Compressor with receiver.
2—75 H.P. Crocker-Wheeler Motors, 25 cycle, 3 phase, 550 volt, 750 R.P.M.
1—75 H.P. Can. Westinghouse, 25 cycle, 3 phase, 550 volt, 750 R.P.M.
3—Gas Furnaces.
2—High Speed Hack Saws.
1—No. 2 Standard Double Acting Press.
1—2,500 Ampere Plating Dynamo.
1—No. 9 Buffalo Conoidal Fan.
1—No. 5 Sheldon Exhauster, Motor Drive.
1—No. 2 Garvin Screw Slotter.
1—No. 1 Garvin Screw Slotter.
1—No. 2 American Oil Separator.
1—14 x 24 C.H.V.W. Mechanical Plater.
6—No. 2 Garvin Screw Shaving Machines.
8—B. & S. Polishing and Finishing Machines.
Pulley, Shafting, Couplings, Hangers and miscellaneous small tools.

The above equipment open for inspection at our plant, corner of DUFFERIN and KING STREETS, TORONTO

Free Tool Grinding Chart

Grind your cutting tools in exactly the right way to get best results—and you save time. That's obvious. It is precisely that that this Tool Grinding Chart enables you to do.

It has been adopted as standard by many firms that found it a long way better than guess work.

CANADIAN MACHINERY would like to see this Chart in every shop in the Dominion. Mail the coupon below for your copy to-day.

Shows at a glance Correct Clearance and Rake Angles for Cutting Tools

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

MACHINE TOOLS AND METAL WORKING EQUIPMENT

Chas. P. Archibald & Co., Montreal.
The Canadian Fairbanks-Morse Co., Montreal, Que.
The Garlock-Walker Machinery Co., Toronto, Ont.

Over eight pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

Give Them A Chance!

Your employees should be given a chance to work under the best conditions possible. The success of your business depends largely on their health and their ability to turn out the maximum amount of work each day.

Foul air, gases, vapours, etc. are injurious. These can speedily be removed by efficient ventilation, and "efficient ventilation" means "BURT" Ventilators.

There are six different models of the "BURT," each one designed to meet special conditions. All have been subjected to the most severe tests and have **proven** satisfactory.

Put your ventilation problem up to us—our staff of Engineers is at your disposal.

Sole Canadian Manufacturers of "BURT" Ventilators

What Are Your Costs?

THE other day a man walked into the offices of a well-known Ontario Company. He asked for Mr. ———, the Manager, and in due course got him.

This caller—he proved to be a well-trained expert on factory production costs—almost startled the manager by asking point-blank, "What Are Your Costs?" The manager, hardly understanding the question, asked what was meant.

Now, in the answer he got, there is something that every factory production man may well think about. He did, and he was so impressed that, after investigation, he changed one of his manufacturing methods entirely! The answer was: "Mr. ——, I would like to know if your operating costs are the lowest possible, consistent of course, with efficiency. I know, of course, that you do a good deal of welding on tanks. I know further that you are using acetylene or forms of welding other than electric. I do not know what this costs you, but I make you this proposition. On your next tank order acetylene weld or rivet half the tanks here. Send the other half to Toronto. Our shop there will electric weld them and return them to you. I will let you know the time it took and the cost. When you have these figures compare them with your own. If they are lower and the workmanship as good, or better, let me then go into details as to whether you should install a Lincoln Welder in your own plant here—or whether it would save you money to do it in our welding shop. You decide only after you have the figures."

This manager adopted Lincoln Welding some six months later.

YOUR costs! Do you check them when business is slack or when it is booming? Why not do it while you have ample time? Let us put our figures before you. Make your own comparisons—that is the only fair way for you. The Lincoln Electric Co., of Canada, Limited, 136 John St., Toronto. Phone Adel. 7200.

LINCOLN ELECTRIC WELDING

P & W

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **Good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Labor cost is the big item in a filing job. Money is saved in the long run by discarding a file that has got the least bit dull and buying a new one, because a dull file means two or more strokes where one should do the work. The following brands will be found to give maximum service before showing wear:

Kearney & Foot

How to Plant an Advertising Crop

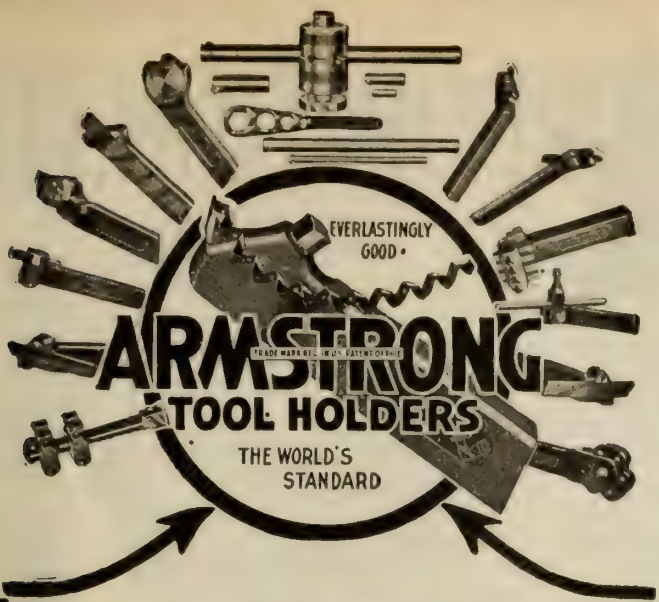
Until the advent of the Audit Bureau of Circulations, advertisers sowed their business seed in a vast but fallow field. Some of it grew and returned a fair harvest—much of it was cast upon barren ground and was lost. There was no standardized method of determining the fertility of a publication's field. Experimenting was expensive.

The A. B. C. has eliminated the barren spots of circulation. Planting an advertising crop is no longer an experiment. Advertisers **Know** the field through audit reports. They know whether it is fertile ground and sow their seed accordingly.

The Canadian Machinery circulation has been audited by the A. B. C. Advertisements placed in this publication are seeds well sown.

HEPBURN PUMPS

An Improved Self-draining Type



Practical users of pumps will appreciate the many advantages—the increased length of service—the greater efficiency made possible by the use of this adaptable pump. The self-draining feature, economy of steam, and the accessibility of the valves are a few of the reasons why this pump merits your earnest consideration.

Ask us for the particulars. We also make Vertical Engines, Compressors, Cranes, Winches, Derricks, Planers and other Machine Shop Equipment.

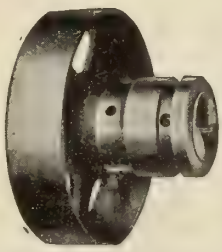
THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building." and our Yellow Catalog.

J. H. WILLIAMS & CO., Limited
"The Wrench People"
45 Thorold Road St. Catharines, Ontario

The Life Blood of the Factory

Dirty, gritty lubricating oil will junk your machinery long before its time. *Friction is production's worst enemy,* and the wear and tear caused by dirt and grit in oil slowly but surely wears out expensive bearings and other machinery parts.

Clean oil prolongs the life of machinery. Bowser Lubricating and Filtering Systems assure clean filtered oil on all bearings and restore the oil to its original lubricating quality. Try the Bowser Perfected Process of Seepage Filtration.

Installation takes a minimum of floor space.

BRISTO
REG. U. S. PAT. OFFICE
PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

For

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working —marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

Sun Life Building, HAMILTON, ONTARIO

The Hammer With The Human Stroke

HEADS RIVETS COLD

Heads 'em tight or loose, flush, countersunk, or finishes heads any shape desired, and at the rate of:

A rivet a second, sizes up to 3/16".
A rivet in two seconds, size 1/4" to 3/8".
A rivet in three seconds, size 7/16" to 5/8".

And on special order we build machines to handle rivets up to 1 1/2" with proportionate rapidity.

Built in eight sizes.

Besides riveting, the High Speed Riveting Hammer does all kinds of peining, swaging, upsetting, etc.

Send us sample assembly parts with rivets or sketch of your work,

and

Let us shoulder your riveting problems.
Send for the High Speed Hammer Book.

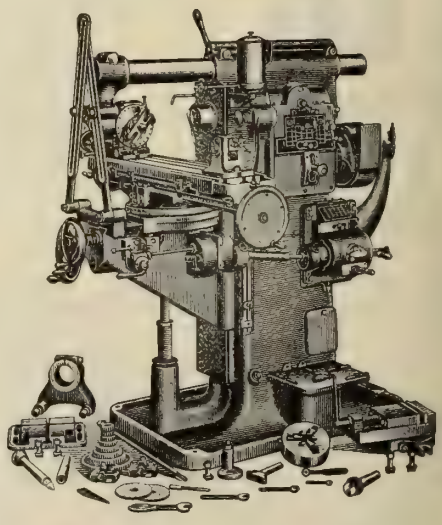
Better Work
With

McDougall SHAPERS

16 and 20 inch Crank

Modern methods of manufacture require modern tools. McDougall 16 and 20 inch Shapers embody the best features of all machines which have been placed upon the market and can be depended upon to produce work accurately and fast.



An important feature is the column. It is massive in construction, well braced and reinforced internally. Has ample opening under ram for keyseating or other long work. Bearings for ram extend beyond vertical line of column both front and back. The ram is of exceptionally strong construction. McDougall shapers have other points of interest you should know about. **Write for full description.**

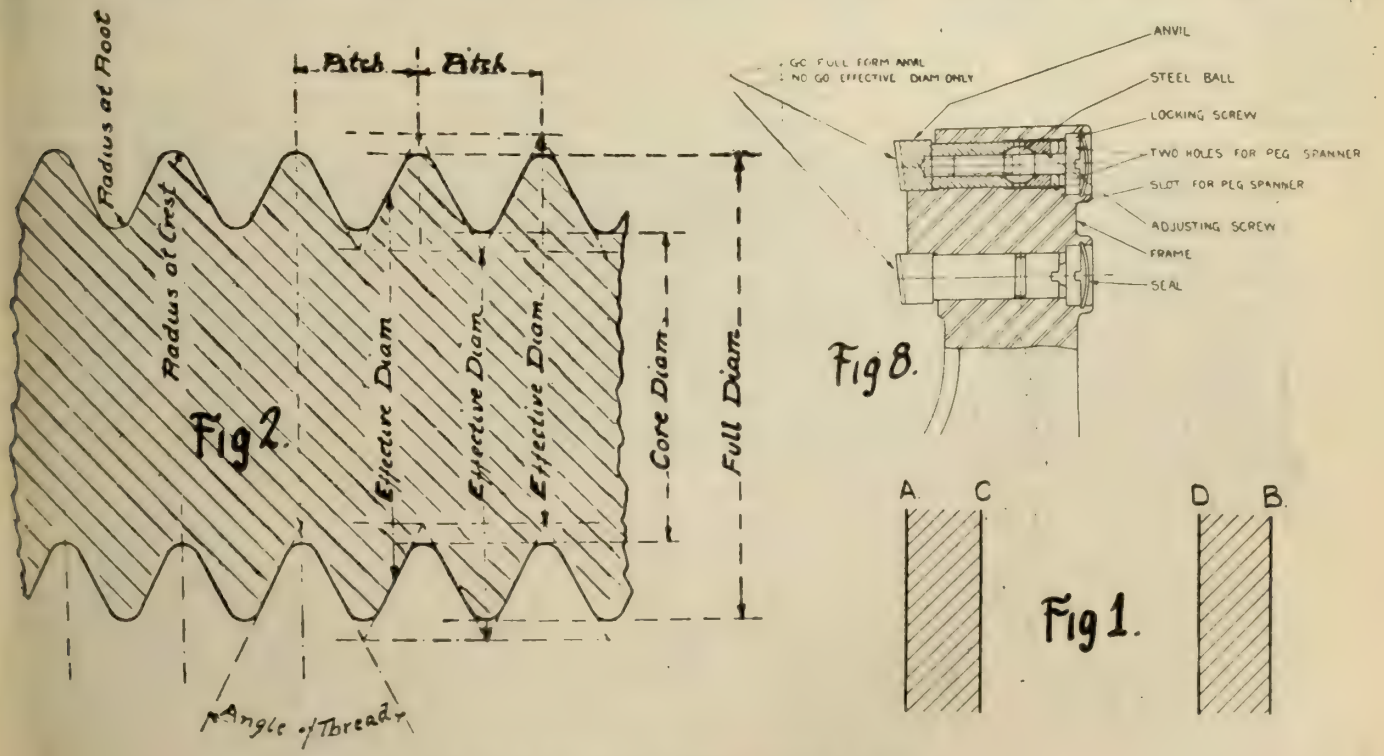
The Need of Gauges for Modern Manufacturing

Modern Gauges Are Very Necessary If Production and Accuracy Are To Be Obtained—Definite Limits Should Be Set—These Depending Upon The Nature of the Work.

By A. C. WICKMAN, B. Sc.



IN ENTERING a subject of such wide possibilities, it is only natural that we shall have to keep to some definite trend of thought, otherwise we will never arrive at a successful conclusion.

The hypothesis which we shall have to take will be first the need of gauges for modern manufacturing purposes, and secondly the need of definite limits for particular jobs. No attempt will be made to discuss the different types of limits as this would be subject matter for an article in itself. The plain gauging of parts such as plain holes and shafts can also only be treated very curtly, while location and position gauging will have to be omitted altogether.

The subject matter will refer particularly to the method of gauging screws, as this is a section about which more conflicting ideas and wrong conceptions exist than about any other type, while the part dealing with fine measurements, in addition to including screws, will deal particularly with the accurate comparing and checking of gauges which warrant the finest methods possible, also the types of measuring machines which are required by the modern factory.

While limits on components have been recognized for many years, it was not generally realized until the beginning of the war that gauges which were required to test components had, of necessity, to be made to limits also, and that these limits were governed to a large extent by the limit of the component. It had been customary for years to mark gauge dimensions as an exact figure, sometimes running to the fifth decimal place, it being left to the judgment of the tool maker (who had no knowledge of the limits of component) whether the gauge was scrap or not.

This state of affairs arose entirely out of the fact that the measuring equipment available was not sufficiently accurate and, when combined with the personal element of the measurer, by which it was greatly affected, could be made to produce results with errors which were equivalent to the practical errors of the craftsmen. I have often met with the argument that if this is so, why is it that machines built in those days were as well fitted as modern ones, and further, why worry about fine measure-

Figs. 1. 2 and 8. Showing the conditions spoken of in text.

ments and expensive gauges? This argument is easily answered, if the conditions under which the articles were made, are examined.

It is quite obvious that an easy way of making parts fit irrespective of price, is actually to fit the parts together in the same shop, an operation at which some of our old mechanics excelled, and which was responsible for their pride of craftsmanship.

Now so long as everybody made articles in this way, the method had no serious competitor, but in America, about the time of the Civil War, manufacturers had discovered that an article could be considerably cheapened by making its components interchangeable and devoting whole shops to the production of one such component. This also, of necessity did away with fitting, but brought about the great difficulty which necessitated the almost complete overthrow of our ideas of mechanical craftsmanship. The new factor was the reproduction of size. This had never been necessary when parts were fitted together, and it was found that while a man could fit a shaft to a hole to an extremely fine limit, he was unable to reproduce the size of the shaft or hole to much wider limits. While mating one piece with another is entirely dependent on the personal element of the operator for its accuracy, this same personal element made reproduction of size an impossibility, and it is an impossibility to-day.

It is true that the limits of error have decreased to an extent which a few years ago would have been thought impossible, nevertheless they still exist and for all we know will always exist.

Keynote of Interchangeability

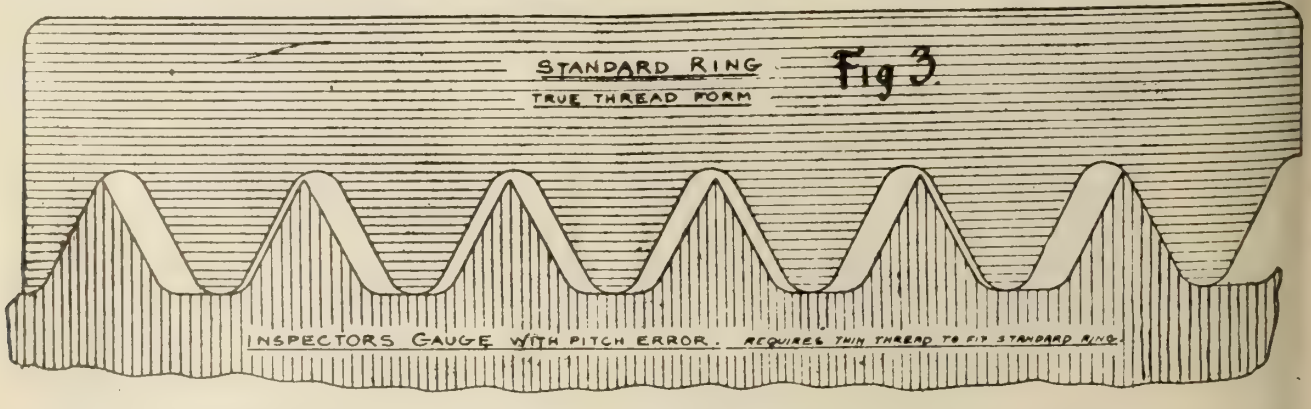
As reproduction of size is the keystone of the arch of interchangeability, it will be seen how necessary it is to employ means both of gauging and of measuring which will make this as easy as possible.

Perhaps I ought to make this more clear. When I say that reproduction of size is essential to interchangeability, I do not mean reproduction of a certain size in the component itself, but reproduction of that component within limits, though wide ones, of the finest possible definition, and it is in fixing the boundary line that reproduction of size plays such an important part, as a limit can only be defined and exists as such by means of boundary lines. The statement, therefore, that reproduction of size is the keystone of interchangeability is a sound one. It may seem very paradoxical to say that the more accurate we make our gauges, the greater will be the limit on our component, but this is true nevertheless, as the diagram at Fig. 1 will illustrate.

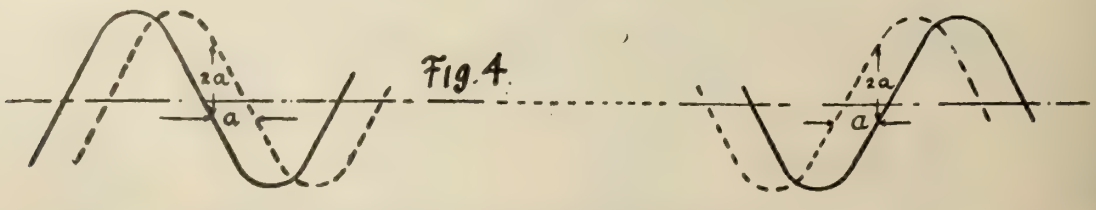
Suppose a component with a limit of .004; this limit is fixed by the use of the component in practice and in the manufacturing conditions under which it is made. It is obviously made as large as possible in order to reduce the cost as much as possible. Let the two lines A and B represent this amount enormously magnified; suppose the error in the Go gauge to be .0005" and a similar error in that of the Not-go gauge; let us also allow .0005" of wear to take place before scrapping the gauges; we see that the boundary of error and wear in the Go gauge can be represented by a line C and similarly in the not go by a line D, we see that the component will be made within the limits CD instead of AB. It is obvious that we cannot allow the spaces AC and DB to fall outside our final limit, otherwise we shall at some time or other be producing work outside those limits and therefore scrap.

From this it will be evident that the narrower we can make those spaces AB and CD, the better it will be, but to do this again brings us up against the problem of duplication of size. When we consider that for many holes made to Newall, A limits the complete limit X is only .0005, you will see how much of that limit is swallowed by inaccuracy of the gauges of as little as .0001". This shows how the limit on a gauge is controlled by the limit on the component.

We are also faced with a third factor which we have just mentioned, namely, the question of wear on gauges, just in the same way as a limit is fixed on the manufacture of a gauge, so there will have to be a limit of error allowed, after which the gauge is scrap. This is just as important as the manufacturing limit of the gauge, as the sum of these limits has to be subtracted from the limit of the component.



It is true that this quantity wear would not influence the fit of the components if we scrap the ring gauge at the same time as the plug, and if we could allow that the wear on the plug be equal to the wear on the ring. When however we consider that Not-go gauges scarcely wear at all compared to Go gauges, and that in a large factory new plug gauges may be used with old ring gauges, and what is more, a component made in six months time must interchange with one made today, we see that the question of wear cannot be neglected.



Now, in many factories gauges are not scrapped until it is noticed that components which have been passed by inspection do not assemble. As the Production Shop is always anything up to a month ahead of the Assembling Shop every article from the first one that does not assemble to the one when the machine is reset to the new gauge, has to be resized or scrapped. The enormous loss due to this is obvious.

The only way to overcome this is to inspect periodically all gauges, either in the Tool Room or Gauge Inspection Department where all limits of allowable wear are known. The period of use between inspection will vary according to the wear limit, the frequency of use and the type of gauge—anything from 24 hours to a month.

Interchangeability of Screws

With these preliminary remarks w

Figs. 3 and 4.—Text matter explains everything thoroughly.

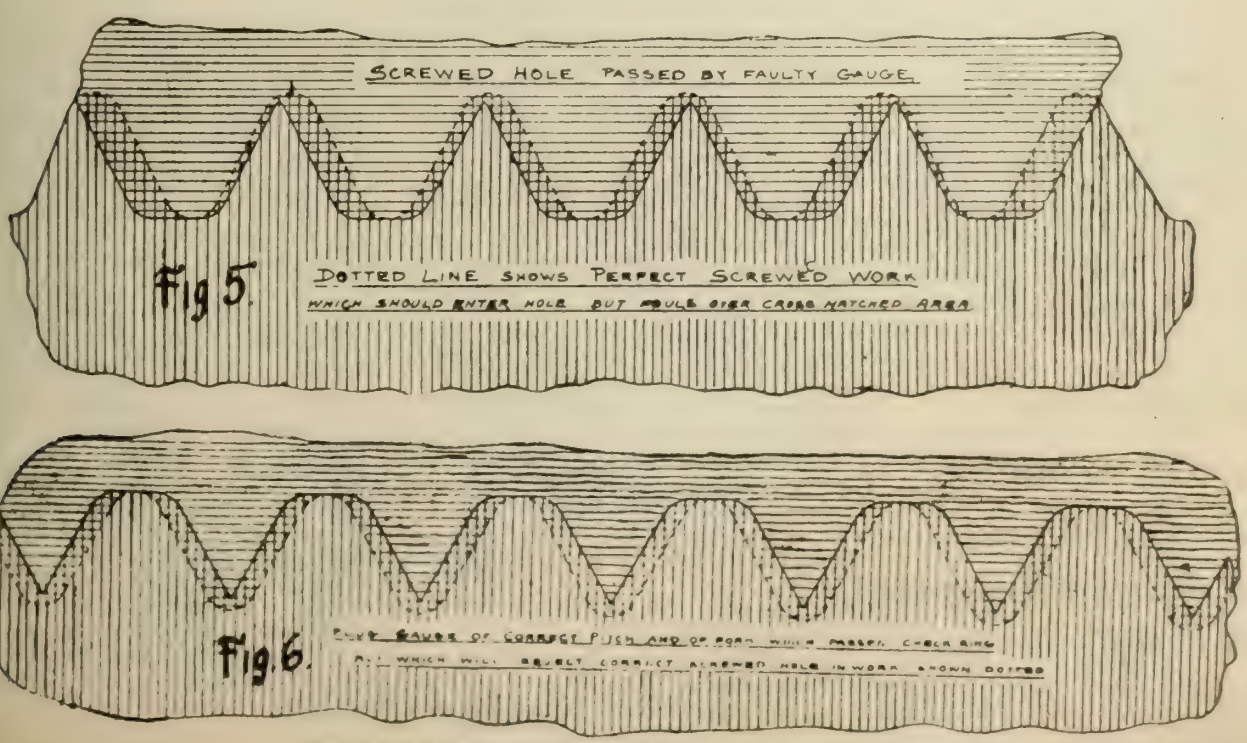
will deal with the question of the interchangeability of screws. In Fig. 2 we have a few threads of Whitworth form, and it will be interesting to note the important points. Of course, the denominations of the various parts of the thread, such as "major diameter," "effective diameter," "core diameter," "pitch radius" and "angle," are well known, so now let us see which of these elements is the most important, and how they are co-related.

To begin with, we must take the natural function of screws; they are usually required to hold two pieces together, and in so doing may be subjected to great strain. From the first principles of machine design, the two parts of the bolt or screw, that is the shank and the thread must be of equal strength.

We also see that screws of the pitches usually employed are very inefficient machines, due to the low helix angle, and that most of the wrench power when tightening up is lost in friction. This friction naturally causes quick wearing of the threads and therefore in places where screws during their life have to be taken out and replaced frequently we have to make an additional allowance for the threaded portion in order to give the screw a useful life. The latter point is most important in small screws used in electrical and scientific instruments where the removal and subsequent tightening up of the screws a few times often scraps them, and when the tapped hole fails in the same manner it scraps the component as well.

Now it will be obvious, in view of the foregoing arguments that the only place where threads can take up side strain under the best conditions, is the flank; so that threads which are to function properly, as described, must fit on the flanks and can, without harm, clear both on the core and on the crest.

I always think that next to hardening there were more legendary and silly beliefs in the art of screw gauge making and the use of screw gauges than in any other mechanical process. I still come across the man who tells me that he has never used screw gauges and has no trouble with the fit of his screws. Of course not! He does not realise that it is only when the form of the thread is made accurate in order to obtain flank contact, that trouble in interchangeability occurs. I could make you screws without gauges that would always assemble into a tapped hole, just as in the same way I could produce a 1" shaft which would always go into a 1/16" hole. That man has never realised that he is producing a thread the effective diameter of which is many hundreds of an inch (not thousands) below nominal. That is, the thread is a mere wafer, and is then thin enough to take up any pitch error that may occur, either by clearance or by bending, and if the major diameter fouls, well it is crushed down when screwed into the tapped hole.



Now the curse of a condition like that is the fact that such a screw, if correct size on major, will assemble into a tapped hole tight, and that manufacturer sits back and thinks he has made a good job. Has he? Imagine that thread when it is strained and taken out to be replaced, it will nearly fall into the tapped hole next time, and how delighted the owner of the part will be when he buys a new screw from some source or other which is correct, and finds that due to this manufacturer making his screw threads so thin, he has been able to use a tap long after it has got below standard size, and that the screw he buys will not go into the tapped hole into which the old one practically falls. Yet this is not an exception, it is a daily occurrence.

To attain a good fit on the flank of a screw, would at first appear quite a simple proposition, it being merely necessary to watch the form and angle of the thread, but when we examine the thing more closely we shall see that this quality is more difficult to attain than it first appears.

Fig. 3 shows 6 threads of a screw in engagement with a tapped hole; it will be seen that the screw has a plus error in pitch compared with the tapped hole. The major and core of the two parts could agree, the angle of the thread on both being 55 degrees, yet due to this pitch error there is a fundamental difference between the two parts. On any strain coming into action from any direction, due to the tightening up of a nut, the first threads will have to bear all of the load or be partially sheared axially in order to allow the other threads to come into engagement, and so take their proportion of the load. While we are ready to admit that this must happen in all screws, due to the impossibility of perfection, it is evident that some limit must be imposed if strength and long life are to remain.

We notice in Fig. 4 that an axial displacement of plus "A" minus "A" gives rise to an increase of effective diameter of approximately 2A, this is doubled on the diameter so that the maximum displacement 2A, increases the effective diameter by 4A, therefore a displacement of "A" increases the effective diameter by 2A; but according to our description of effective diameter, that is a measurement of any line at right angles to the axis cutting the flanks, this effective diameter will not have altered.

We really require another term to designate the rise of effective diameter due to pitch. For the time being we will designate the effective diameter as measured with the needles across any

Figs. 5 and 6—Read explanatory text in connection with these views.

two threads, as the "simple effective diameter" and the effective diameter—due to pitch error in a length of thread, as the "compound effective diameter," therefore if K equals the pitch error per inch, Es equals the simple effective diameter, and Ec the compound effective diameter, then we know that Ec minus Es equals 2K, or Ec equals Es plus 2k. The figure will not be quite 2 as the angle is 55 degrees instead of 60 degrees, but for simplicity we will take this to be sufficiently accurate. The British Engineering Standards Committee have used the terms "Grade" and "Play" of a screw in order to differentiate between the compound effective diameter and simple effective diameter, but personally I prefer the latter definition, as it is not so open to misunderstanding.

You will notice that while Es is dependent on diameter only, Ec is a function of length as k is expressed in inches per inch, and therefore the increase, that is Ec minus Es will be twice as much for a screw 2 inch long as for a screw 1 inch long, and if we regard the quantity 2k as a constant, we can grade our screws by a designation which we may call pitch engagement, that is the number of threads or length of screw required to give it a compound effective diameter equal to nominal. Obviously the better the screw, the larger the number of threads would be. In a theoretically perfect screw, Es would equal Ec, so that the length could be infinite.

The whole accuracy of this designation rests upon the possibility of calling the quantity k, that is the pitch error, a constant; the fates have unfortunately decreed that pitch error shall be one of the most inconsistent things possible, and no matter how a thread be cut, whether by a die, tap or chaser, consistency of pitch is impossible, and therefore the quantity which we have called 2k will be twice as inconsistent, and therefore it is all the more impossible for us to call this quantity a constant.

Designating Screws

Next let us consider what happens if we designate screws by the length of thread required to bring their compound effective diameters to nominal. Take two screws, one with a pitch error plus .001″ per inch, and the other with a pitch error of plus .002″ per inch; assume the pitch engagement or number of threads to bring their compound effective diameters to nominal to be 10 threads, therefore we have

$$Ec_1 = Es_1 + .002''$$

$$Ec_2 = Es_2 + .004''$$

But $Ec_1 = Ec_2$ both screws having the same pitch engagement

Therefore $Es_2 = Es_1 - .002''$

That is the simple effective diameter of the second screw is .002″ less than that of the first, but as we have shown before, the simple effective diameter is a measure of the strength and longevity. It stands for quality, and therefore the second screw is only half the quality of the first, yet has the same pitch engagement, so that in order to be able to grade screws in this way, we must know the pitch error, the actual term pitch engagement without that, gives us no idea of the quality of a screw.

From the foregoing it is clear that we must keep pitch variation as low as possible.

There is still another aspect of compound effective diameter which we must examine, since compound effective diameter is co-related to pitch error and pitch error is got by comparing a certain pitch with a standard pitch, a screw will have a different compound effective diameter according to the standard, against which it is compared. Let us imagine a screw of sufficiently large diameter to be chased in a lathe, say an axle tube of a motor lorry and imagine it having to fit into a screwed hole in the axle tube bracket which bears the brake arms, etc. Suppose both the parts have a pitch error of plus .004″ per inch; now we know that the compound effective diameter of the axle tube will rise .008″ and therefore it will have to have a simple effective diameter of minus .008″ in order to screw into its gauge tight, the compound, effective diameter of the axle tube being got here by comparing its pitch with the standard, that is the pitch of the gauge. In the same way the compound effective diameter of the hole will be reduced .008″ and therefore in order to pass the plug gauge the simple effective diameter must be increased by a similar amount, the pitch again being compared to the standard; but when the two parts are screwed together we see that both of them have the same pitch, that is, co-relatively they have no pitch error, and therefore their compound effective diameters are equal to their simple effective diameters when compared with each other, but as we have shown these differ by .016″ approximately 1/64 inch, the two parts will therefore fall together and may be scrap.

From Figs. 5 and 6 it will be seen that the Screw Ring gauge does not fulfil the conditions necessary to produce good screws on an interchangeable basis. In the first case, its true size is extremely difficult to measure, involving the use of a large number of Go and Not-go Check Gauges, complete set of these for every Ring Gauge in use being far too expensive for the every day Shop; so that we can take it that as a general rule the wear on a Ring Gauge can never be accurately measured. In the next place, the fact that a Ring Gauge screws on to threaded work gives no indication that the work is any use. This we have shewn; also, if the Ring Gauge does not screw on, no indication is given of what is wrong:

A system of gauging which would: (1) Be accurate; (2) Allow of easy periodical inspection; (3) Be adjustable so that it can be kept to standard size and the wear limit reduced to a negligible minimum; (4) And of such form as to put a definite limit on the simple effective diameter; will give us the advantages required to produce good work. Such a gauge is shown at Fig. 7.

Adjustable Gauge

As you will see, the gauge is an adjustable thread snap gauge and has been developed from the plain adjustable type of snap gauge. The frame is of a high quality chilled cast iron of such a section as to reduce elasticity to a minimum. If this frame be thrown with sufficient force on a hard floor it will fracture. This is a safety feature. A frame made from a drop forging would in such cases be intact but there would remain in all probability a gauge having a considerable error, resulting in the scrapping of valuable work.

The first set of anvils is threaded on a precision lathe to true form, and after hardening is tested for pitch and projected for accuracy of form. The various elements are also measured by means of vees and needles in the same manner as a screw plug gauge. The second set of anvils is shorter in length than the first, consisting only of 2 or 3 threads which are cleared completely at the root and topped off at the crest; they merely test the effective diameter of the screw; they are calibrated by means of standard N. P. L. needles and the distance from the topped-off portion to the true effective diameter is etched as a constant on the back of the anvil

Assuming the first set of anvils set up to a hardened and ground plug (the size of which is the true core diameter of the thread to be gauged) or to a standard reference Screw Gauge kept for that purpose, the anvils will present a section of a Ring Gauge with the accuracy of a Screw Plug Gauge. On the work being passed through them it will be obvious that no element of the thread on the work is larger than nominal. Assuming that .006″ is the predetermined limit which can be allowed as a decrease of effective diameter or thinning of this thread in order to produce satisfactory fits and long working life, the second set of anvils is set this amount below nominal by means of another plug gauge. The second set of anvils will now represent the true section of Not-go effective Ring Gauge .006″ below size, and if the work does not pass through these anvils it is obvious that the effective diameter is not below this predetermined amount and therefore the screw will not only assemble into the component but will also assemble to a predetermined and have a known length of useful life. If the screw will not pass the first anvils, on holding the gauge up to the light with the screw between them, the operator can easily see what element is interfering and know what to correct. Each of the anvils has an adjustment of ⅛ inch, making a total adjustment of ¼ inch.

The references can be either hardened and ground steel cylindrical gauges or reference screw plug gauges and for inspection the reference need only be passed through the anvils to see if any wear has occured. If this is the case, the gauge is easily adjusted back to standard size. In this way there need never be any inaccuracy of the set up gauge of more than .0008", a condition impossible with a ring gauge, for, as we have shown, the amount of wear of this is never accurately known. The mechanism of the gauge is so arranged that it is impossible for the anvils to get out of square and also the gauge is absolutely tamper-proof. Fig. 8 shows the details of construction.

Details of Construction

The adjusting screw is covered by the locking screw which in its turn is covered by a lead seal closed into the recess at the top of the gauge by means of a special press. This press indents the firm's monogram or trade mark in the seal thus preventing any unauthorized tampering or alteration. The inspector on issuing such a gauge to the shop can feel confident that he will not have spoilt work returned to him, together with tampered gauges. The press when out of use can be locked with a padlock and the key retained by the inspector.

The adjustment of the gauge is very simple and is such as permits of extreme accuracy; the stem of the anvil, which is hardened and lapped to fit the hole, is coned out on the top to an angle of 60 degrees in which rests a hardened steel ball. The adjusting screw, which is also hardened, has a similar cone underneath it and presses down on the same steel ball. The locking screw, the head of which bears in a counterbore on the top of the gauge, passes through the hardened adjusting screw, through the clearance hole in the steel ball and into a tapped hole at the bottom of the countersink in the stem of the anvil. Two holes are provided in the head of the locking screw, and a special peg spanner (with prongs which go through these holes into the slots of the adjusting screw) is used for setting the gauge.

To set the gauge, screw out the locking screw with a screw driver a few turns; drop the peg spanner in position and rotate. The pegs will drop into the slots of the adjusting screw and rotate it. The cone of the adjusting screw will push down the hardened steel ball which, in its turn will force down the stem of the anvil. Adjust the gauge so that it grips the standard slightly tighter than required. Remove the peg spanner and lock the lock screw.

By giving the locking screw an extra twist with a screwdriver it is possible to get any desired feel between the anvil and the setting gauge. The hardened steel ball is compressible a few ten-thousandths of an inch and on twisting the locking screw an extra amount the

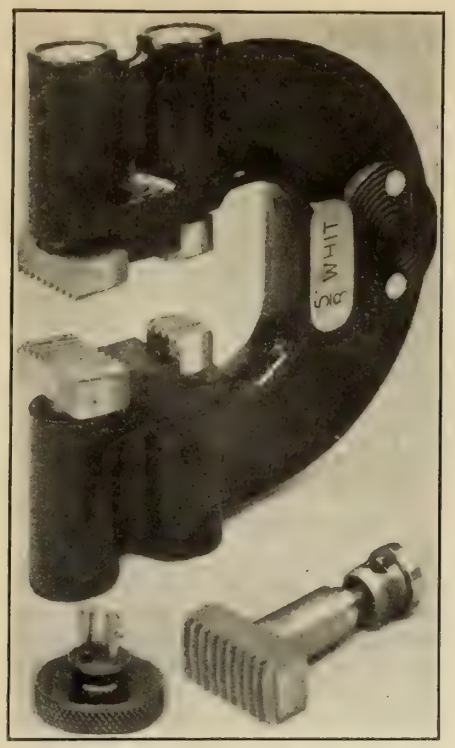


Fig. 7.—Gauge explained in text.

anvil can be slightly drawn back to a limit which is quite impossible with the ordinary type of adjustments in use at present. When so locked it is impossible for any back-lash to be existent between the adjusting screw and the stem of the anvil, and, finally, after sealing, tampering becomes an impossibility, as an attempt to set the gauge in a vice would result in the fracture of the frame. Summing up the advantages briefly we have, length of life, complete visibility, absolute limit on the minimum effective diameter, easily adjusted, easily inspected, and absolutely tamper-proof when adjusted. It tests out of roundness or concentricity, and is really a combination "Go" and "Not-Go" gauge, so that the only one adjustable thread snap gauge is required. Last but not least the maintenance changes are negligible.

This then gives us a method of looking after production of the screw, but obviously we must in some way look after the limits in the tapped hole. How this is best accomplished will be considered in the next portion of the present article.

THE PRICE OF PAPER

In an effort to reduce production costs by getting lower prices on their paper supplies, publishers who are members of the Canadaian National Newspapers and Periodicals Association asked for a conference with paper manufacturers. This took place in Toronto recently and the situation was fully discussed. It was pointed out that at the present time some publishers are actually paying more for paper than in 1920, while the ruling price on book paper is 100 per cent higher than in 1914. In some cases even more than 100 per cent increase is being paid. Unfortunately no relief is promised by the paper manufacturers. This does not, of course, refer to the grade of paper used by daily newspapers, which is materially lower in price now than in 1920. Publishers of agriculture, business, educational, religious and technical newspapers and magazines in the United States, all of them in direct competition with Canadian publishers, are buying their paper at from 25 to 40 per cent less than the prices paid for paper used in the magazines noted above. To make it worse, the U. S. publications are admitted to Canada free of duty.

According to reports British blast furnaces are again firing up. Forty out of 300 are already started and 200 more are expected to be in use within the next two weeks.

TRAIN RECORDS IN VARIOUS PLACES

A table of interest, insomuch as it shows various records of trains, and boats, is shown below. These figures of course cannot be taken as average conditions, but rather as records established at some particular time. Take for example the first two items, viz, the Empire State express in America, and the Great Western express in England. While the American train shows a better speed per hour, the road run over may have had a lot to do with the record made, for as an average, the English trains run at a faster speed than those in the United States. It would also be interesting to compare the Mauretania record with some of the old time sailing ships that used to cross the same stretch of water.

Noteworthy Train Records

Vehicle—Country.	Date	Miles pr. hr
Empire State Express, United States	1893	112.5
Great Western Express, England	1842	72.0
London-Aberdeen, Britain	1894	63.3
Paris-Calais Express, France	1899	57.1
Electro locomotive, Germany	1901	130.0
London-Exeter Express, England	Now	57.9

Other Noted Speed Records

Mauretania, transatlantic	1910	4d. 10h. 41m.

Experiences in Sixteen Years of Drop Forging

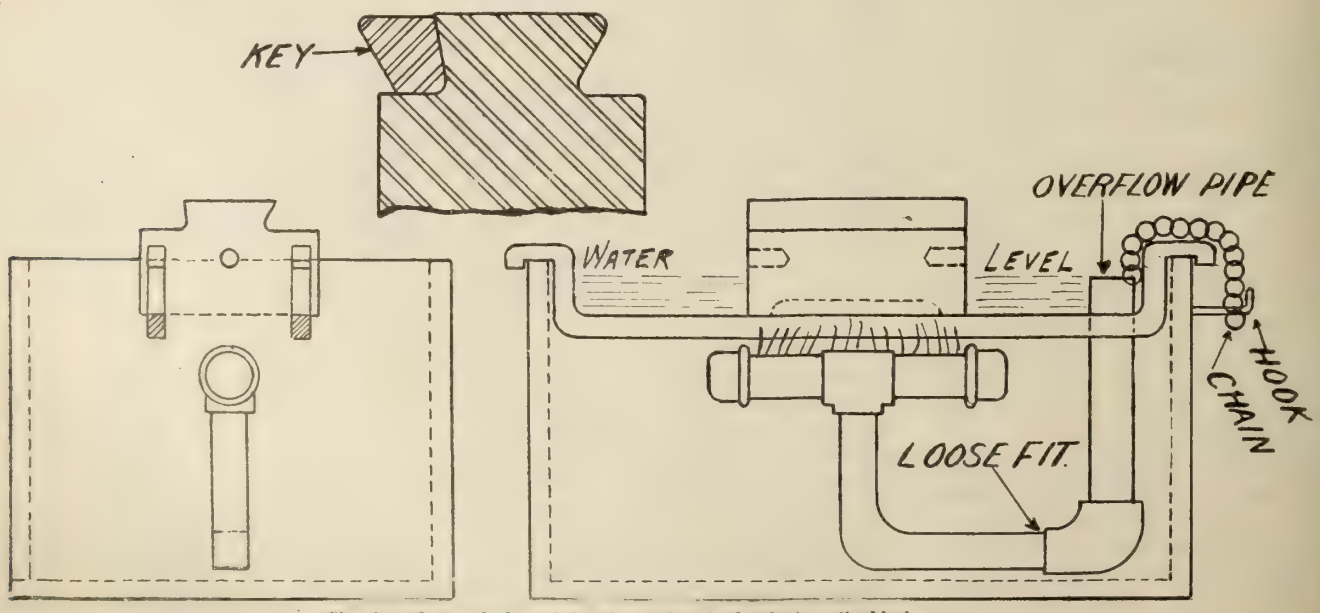
How Long Should a Die Be Kept in a Furnace?—Proper Method of Hardening Drop Dies—Round Corners Save Many a Break—Counteracting Warpage

*By WALTER ROWLANDS

HAVING read an article on the subject of "Hardening Drop Forge Dies," in the August 4 issue of Canadian Machinery, I decided to write you regarding my experience of about 16 years in drop forging, designing drop hammer dies, or rather designing the break down, because that is the important part of such dies. During my years of experience I have read a great many articles and have seen quite a number of sketches in the various mechanical journals from time to time, but I don't think I have read an article on the above subject that gave any idea of how long a die should be kept in a furnace, taking into consideration the fact that a regular and steady heat is kept up on a good type of muffle furnace.

My object in referring to the subject in this light is because so much has been said and printed about helping the new beginners or apprentices, not only in the forging business but in all other lines of the mechanical trades. I mention this designedly, because it is quite noticeable as you travel around that so few youths are learning the blacksmithing or forging business, and you cannot very well blame them for the simple reason that it is a hot, dirty, and laborious job, and seldom does a blacksmith get beyond a foreman's position.

After the completion of King Solomon's temple it was decided to give a banquet to the artisans who had been instrumental in building it, and in order to seat them in order of merit at the table each one was asked who made his tools with which he did such splendid and magnificent work. One after another acknowledged that the blacksmith had made his tools, and when he was brought forward to answer the same question he answered "I make my own tools." He therefore, was given the seat of honor at the banquet.



*Author was formerly chief of forge department in the International Harvester Co., Hamilton, also in the Farm Machinery Co., Montmagny, Quebec.

Proper Method of Hardening

To get back to the hardening question and arrive at some definite time per inch of thickness of drop dies, the writer has found that close to three quarters of an hour per inch of thickness worked out very satisfactorily, although some very good firms in the U. S. advocate one hour per inch of thickness. However, after 16 years supervision over this branch of the forge foreman's work, by adopting three quarters of an hour per inch of thickness we only broke two dies in that length of time. One of these dies was traceable to a flaw in the steel. It parted in a deep impression some eight or ten hours after it left the forge and it so happened that the steel had a very perceptible flaw on the same line as the impression.

Take for instance a man who has never hardened a die taking the place of an experienced hardener who has left to go to another job. He from experience has been fairly successful in estimating the time and heat to give a certain die, but of course he takes this information with him, the die after being in the furnace about three hours looks to an inexperienced man to be O. K. to harden. It is superficially hot all over, and so we will all admit the heating of drop forging dies is all important. Then why not have some rule for length of time per inch of thickness. The pyrometer gives heat of furnace but does not indicate anything more. Consequently for a given heat with a good type of muffler furnace, why not a given time per inch of thickness I think if all drop forge proprietors would have this looked into some very valuable information would be found that would be beneficial to all concerned. In view of the above I maintain that articles that are published in mechanical journals for the benefit and guidance of its subscribers should give as near as possible something definite and decided. A case in point: A few weeks ago another article on the length of time to heat die blocks was from 3 to 5 hours at a certain heat, say about 1450 Fahr.

The same idea applies to sketches. We all know that round corners are better than square roots in tempered articles, and how important it is in a drop die that has cost say $300 or $400 to eliminate as far as possible any faulty construction or practice that has a tendency to cause fracture or break. The writer has yet to see a sketch of a drop die that showed what it ought to be like in this respect. Take for illustration the article and sketch that appeared in your issue of August 4th, 1921. The sketch shown has square roots at tang. Why have this which is inciting fracture and liable to scrap

Showing the method used by the author in hardening die blocks.

the whole expensive die. It is just as easy to machine a fillet say ⅛ or 5/32 radius in the corner, and why not put bar holes in the front and back of the die? This feature has 3 or more distinct advantages.

1. It enables the machinist to clamp the die on table of either the planer, shaper, or miller without having to change his clamping when machining either the face, tang, front and one side of die as is the usual practice for drop dies with most firms, the front and side usually being about 2" from top.
2. It enables the hardener and his helper to take die from platform or plate in front of furnace and place over water spray in tank with least possible delay which is very essential. Furnace and tank rest should be as near as possible of the same height.
3. It enables the hammer man to either put pins in the holes for crane operation and sling in placing dies in hammer, or by using bars in front and back, he can slide it from truck to hammer. This system of holes is also advantageous in taking to and from the die storage by using pins and sling chain with crane.

The writer cannot understand why it is necessary to place the tang down in the water first until it cools below a red heat, subjecting and inducing the die to warp, not to speak of exposing the important and vital portion of the die to the air unnecessarily, having the trouble and delay of turning the die face down in the water in exact position of impression over spray.

The writer's method was to place the die face down, impressing over the spray as soon as possible, then pour water on the tang either with a hose or two pails in the stands of the hardener and his helper, alternating so as to keep a steady and continuous flow until satisfied that sufficient water has been poured on tang for two reasons.

1. To counteract as much as possible warpage, owing to the shrinkage that is taking place on the face of the die. The heat that is in the centre of the die will draw up through the tang thereby keeping it soft, at the same time helping to relieve the enormous strain that is passing through the steel.

We never allowed a die to cool off entirely in the water. If it was a small die we would drop it in the oil until nearly cold after it came from the water tank. On large drop dies we found it good practice to place our hand under the water and feel the impression. Before the heat had entirely left the bottom of impression it was taken out and placed on a board or hot plate, according to the thickness of die or the heat that was still in the centre.

As soon as possible after this was done, we cleaned off face with emery wrapped around suitable sticks of wood or sand stone. We then watched the face and impressions and according to quality of steel allowed the color (usually a very light straw) to come up. This at the same time was relieving the die of hardening strains, and by following the above method we were enabled to forge intricate drop forgings 10" or 12" long with sharp projections and limited flash up to 80,000 to 90,000 pieces to standard specifications and finish before the dies were taken to the tool room to be tanked up or recut.

My hardener had in addition to the muffler furnace, for dies, etc., a lead pot, and a carbonizing furnace generally filled with pots containing thousands of small pieces. Projecting from the muffler furnace at one side, we had a hollow box shape chute about 10" wide, 6" deep, and 30" long, with a vertical gas pipe in outer end to take off the gases. On the top of this chute we draw tempered all our punches, which were piled up on one end and rolled along top until the necessary color showed. This of course was after they had been hardened and polished on a spindle with suitable chuck. Punches of all diameters came by the box full, consequently wholesale methods for hardening and tempering had to be adopted.

Showing Method Adopted

The sketch showing method of hardening drop dies will illustrate that the die is supported by two adjustable braces across the tank which are of sufficient depth to allow the impressions on the face of the die to be well covered with water. The depth of water for die is governed by the depth of the impressions or irregular shape of the face of die.

The overflow pipe, as will be seen, is an ordinary pipe with a standard elbow from the horizontal pipe leading to the outlet in tank to the adjustable overflow or vertical pipe for regulating the depth of water in the tank. No extra work or expense is required to make an overflow. As far as the adjustable feature is concerned, the elbow can be made an easy or loose fit, and any kind of small chain attached to the top of overflow. A nail driven in the tank at a convenient place will enable you to obtain any depth of water required, as you can swing the joint one way or the other.

The supply pipe is provided with tee joint, and the cross pipe can be made to suit your longest dies. When hardening shorter dies the holes in sprayer can be plugged temporarily to suit the length of the impression of the die.

The Flexible Steel-Lacing Co., published a book on "Short Cuts to Power Transmission," which is said to contain hints on belting, also varied transmission data.

Speeding Up Inspection

TO MAKE the inspection of small parts a task which could be done quickly, accurately and without undue fatigue, the Amphion Piano Player Company has constructed special tables which it has found most satisfactory. Some of the ideas incorporated in these tables are well worth the consideration of factory men.

In the first place, comments H. R. Hampton in "Factory," the feed chute is equipped with a sliding door to retard the flow of parts to the table. Then guide strips fixed on the surface keep the parts from falling off the table and also keep them within easy reach of the inspector.

Two chutes are used, one leading to a tote box underneath the table, which is for acceptable parts. The other chute is provided for those parts which, though faulty, can be put in acceptable condition by the repair man. All parts rejected are thrown into the table-high boxes on the right of the inspector. Work may be rejected for several reasons, and it is necessary to the best production methods to know what proportion of rejects are traceable to each fault in manufacture.

The height of the table and the position of the chutes are designed to reduce to a minimum the fatiguing effect of the work. Another table in the same plant takes care of this need quite easily. To especially equip it for sorting, holes were cut through the top and a small flare-top chimney or chute fitted in each hole. The top of each chute extends a few inches above the table surface and prevents the material from dropping into the holes accidentally. As the inspector works, she passes rejected pieces into one or the other of the little chimneys, according to the nature of the fault. The flaring top on the chute facilitates dropping rejected parts into it.

Each chute leads into an open box beneath the table. The several boxes which catch the rejected pieces are of a standard size, similar to a tall wicker waste-basket—just high enough to be slid under the table. Built of birch, they are substantial and at the same time of a shape that is easy to handle. At the end of any period of inspection, the pieces in each box are counted and the results recorded. Some of the boxes are for pieces which have certain repairable flaws. These boxes are sent on to the repair men. These men can work fast because all the pieces in one box have the same flaw, and they become quite expert in repairing the flaw.

The Bristol Co., Waterbury, Conn., have forwarded us several catalogues covering their line of safety set screws, pyrometer and heating treatment equipment, belt fasteners, etc.

Canadian Machinery Drafting Course Part III.

Surfaces—Plane Figures — Triangles—Quadrilaterals—Circles—Solids, etc. Each Section Is Taken Up in Detail—Two Plates Have To Be Prepared—Careful Workmanship Is Very Essential

By J. H. MOORE

IN Part 2 of this series, which appeared in the June 9 issue of Canadian Machinery, we reached the point where an obtuse angle was defined. Next let us go further into the subject of geometrical terms.

Leaving the angles, we come to the subject of surfaces, which prompts the question, "What is a surface?"

A surface is produced by the motion of any line. It always had two dimensions, namely length and breadth.

There is another type of figure termed the plane figure. This could be explained as follows:

A plane figure is a plane bounded on all sides by lines, the space included within these lines (that is, taking it for granted that they are straight lines) is called a polygon, os as sometimes termed, a rectilinear figure.

Twice we have come to polygons, let us see what types we find.

A polygon proper is a plane figure which is bounded on all sides by straight lines, these lines being called sides, the sum of the sides being termed the perimeter, which of course means all the way around. These polygons are classed according to the number of sides they have and are as follows:

A triangle is a polygon with three sides; a quadrilateral is a polygon with four sides, a pentagon, with five; a hexagon, with six; a heptagon, with seven; an octagon, with eight; a decagon, with ten; a dodecagon, with twelve; an equilateral is a polygon whose sides are all equal, while a regular polygon is one all of whose angles and sides are equal.

These definitions describe in full the various types of plane figure met with in geometrical problems, in fact some of those mentioned in the list very seldom appear, but for the student's benefit have been spoken of in order that he may familiarize himself with the names.

Polygons can again be classified into various headings, in fact such is necessary, so briefly we will discuss some of the general headings. First we come to triangles, namely the polygon with three sides. The angles of a triangle are of course the angles formed by sides. Figs. 1 to 6 in chart No. 1 ilustrate the different type of triangles met with. At Fig. 1 we see the right-angled triangle, or as it is commonly termed, the right angle. The longest side of this angle, that is the side opposite the right angle, is called the hypotenuse, the other sides are simply termed sides, or, as some prefer to say, legs.

Fig. 2, the obtuse angled triangle, is one that has an obtuse angle as shown.

Fig. 3, the acute angled triangle, is one which has all its angles acute.

Fig. 4, the equilateral triangle, is one (as the name denotes) having all its sides equal.

Fig. 5, the isosceles triangle, is a polygon, two of whose sides are equal.

The altitude of a triangle is the perpendicular drawn from the vertex to the base, see line A on Fig. 5.

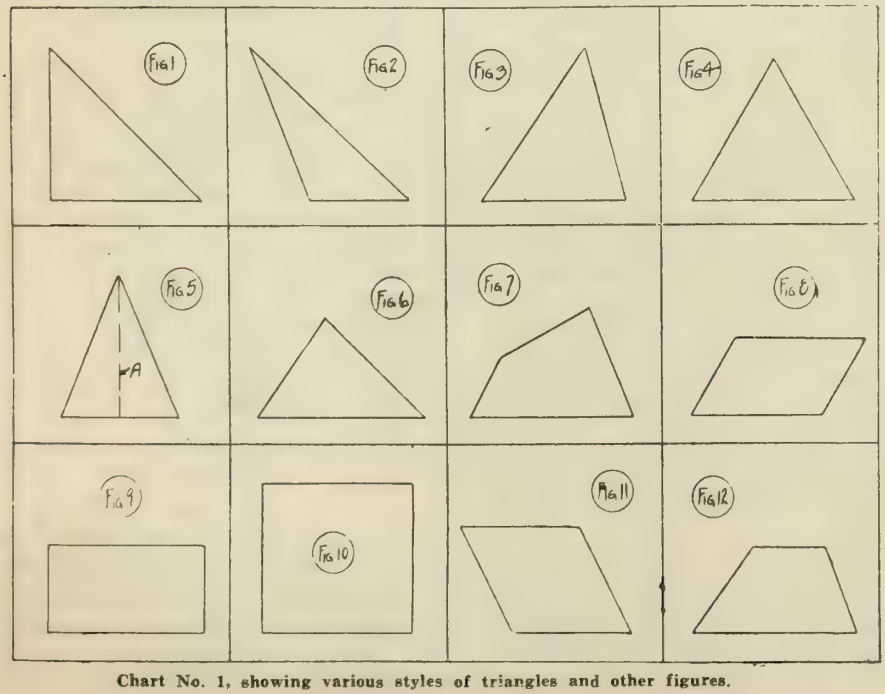


Chart No. 1, showing various styles of triangles and other figures.

Fig. 6 illustrates the scalene triangle. This triangle has no two sides equal.

The lowest side of a triangle is always called the base. Any side may of course be taken as the base, but usually the side upon which the triangle is supposed to stand is generally accepted as the base.

Quadrilaterals

Polygons are again subdivided into quadrilaterals, or polygons, with four sides, of such shape and names as follows:

A quadrilateral is, to commence with, a figure bounded by four straight lines (see Fig. 7).

A parallelogram is a quadrilateral whose opposite sides are parallel (see Fig. 8).

A rectangle is a parallelogram whose angles are all right angles (see Fig. 9).

A square is a parallelogram whose sides are all equal, and whose angles are all right angles (see Fig. 10).

A rhombus is a parallelogram whose sides are equal but whose angles are not right angles(see Fig. 11).

A trapezoid is a quadrilateral having only two sides parallel (see Fig. 12).

Circles

Next let us consider the circle. A circle is a plane figure bounded by a curved line called the circumference, every point of which is equidistant from a point within commonly called the centre of the circle.

A circle in turn has other lines which can run through it, each having their proper name. Let us consider a few of these.

Referring to the chart No. 2, at Fig. 1, we first see the circle itself, O being the centre point. Fig. 2 shows certain added lines to the circle, each having their proper name, A being the diameter, B the radius, and C the tangent to the circle. From this we gather that—

The diameter of a circle is a straight line drawn through the centre, terminating at both ends in the circumference.

The radius is a straight line joining the centre with the circumference.

The tangent is a straight line which touches the circumference at only one point, called the point of contact.

Fig. 3 carries us still further. Here we see a line A passing through two points on the circumference. This is known as a secant. The line B represents a chord of a circle, or a straight line which joins the extremities of an arc, but does not pass through the centre of the circle. The space, or area C included between the arc and the chord line B, is called a segment of a circle.

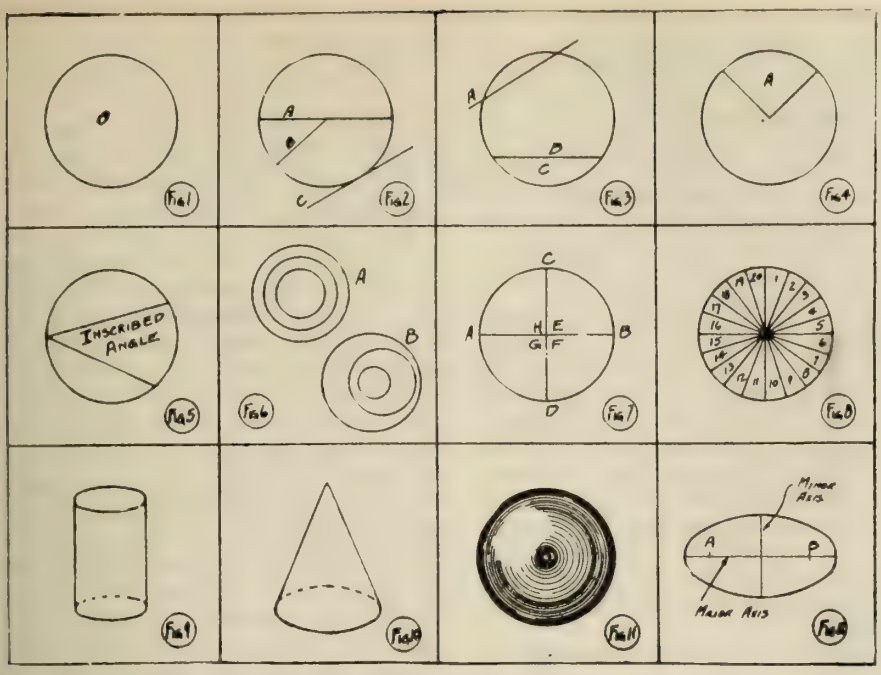

Chart No. 2—Showing the circle and other necessary figures.

Fig. 4 again shows some further terms. The space or area A is called a sector, that is, the area included between an arc and two radii drawn to the extremities of the arc.

Fig. 5 illustrates what is termed an inscribed angle, that is, an angle whose vertex lies in the circumference, and whose sides are chords of a circle. Fig. 6 at A shows concentric circles, while at B are shown eccentric circles, the meaning of each term being self-apparent, namely, that concentric means having a common centre, while eccentric means the very opposite.

The Measurement of Angles

If we construct a circle as at Fig. 7, and draw diameter lines AB and CD at right angles, that we obtain the angles E, F, G and H, each equal in turn to 90°; four times 90, or 360 degrees for the complete circle.

Having established this point clearly, let us pass to Fig. 8. Here we see a circle divided into 20 parts. Each of these parts is equal; therefore we can take 360 and divide it by 20, which shows us that the angle in each separate sector is 18 degrees. We point out this illustration to start the germ of the idea of angles into students' minds, for it is something which will very soon crop up in this course, when naturally we will go into the matter deeper. In the meantime students should remember that a circle has always 360 degrees, a semi-circle (or half a circle) 180 degrees, and that the sum of the angles on any triangle must always equal 180 degrees.

Solids

We shall next consider solids. First what is a solid?

A solid has three dimensions—length, breadth and thickness. (Readers will remember that plane figures had only two dimensions—length and breadth.) Solids are subdivided into classes, the more generally used of which are cylinders, cones and spheres. Fig. 9 depicts a cylinder, Fig. 10 a cone, and Fig. 11 a sphere.

A cylinder is a solid having two equal parallel surfaces as bases, these being bounded by curved lines. The bases are usually circles, and such cylinders are called circular cylinders.

A right cylinder is one whose side is perpendicular to its bases. Fig. 9 illustrates a cylinder of this type.

A cone is a solid bounded by a conical surface and a plane which cuts the conical surface. The plane is called the base, the point which it tapers up to is called the vertex. The altitude of a cone is the perpendicular distance from the vertex to the base.

A sphere is a solid bounded entirely by a curved surface, every point of which is equidistant from the centre of the circle. A ball is a sphere, provided it is entirely round. Fig. 11 represents clearly the construction of a sphere. The shading on this view is given merely to create the appearance of the ball being round.

An ellipse (illustrated at Fig. 12) may be defined as follows.

An ellipse is a curve generated by a point moving in a plane, and in such a manner that the sum of the distances from the point to two fixed points shall always be constant.

The two fixed points are called foci (see Fig. 12 at A and B) and lie on the longest line that can be drawn through the ellipse. This line is called the major axis. The shortest line is called the minor axis, and is perpendicular to the major axis, at its centre or middle point. An ellipse can be easily constructed if its major and minor axis be known.

In order to check up on the foregoing instructions and definitions, students are advised to draw carefully the two practice plates shown at Figs. 2 and 3. In commencing, make your sheet 8 x 13 to the border line, divide this space up into six equal portions as shown, then start on Problem 1.

Problems 1 to 6

Problem 1.—To construct an equilateral triangle, one side being given.

Draw A B 2¾ in. long. With A B as a radius, and A and B as centres, describe two arcs intersecting at C; join CA and CB. The result being an equilateral triangle.

Problem 2.—To construct a parallelogram when the sides and one of the angles are given:

Suppose AB and CD to be the given side, AB 2¼. in. long, CD 1¾ in. long. Let E be the given angle. Draw FG equal to AB and draw GH, making the angle with FG similar to the angle E.

Make line GH equal in length to CD. With H as a centre and a radius equal to AB, describe an arc at I. With F as

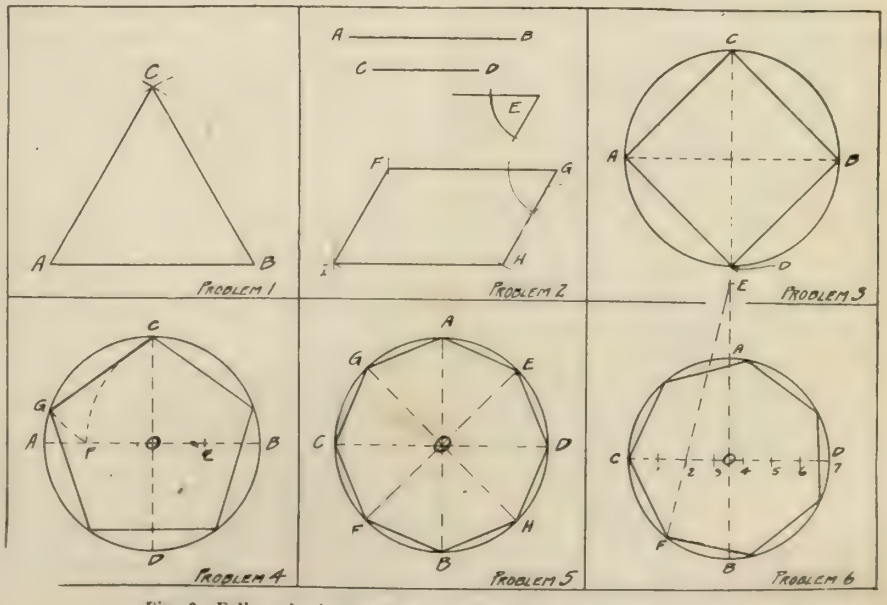

Fig. 2—Follow the instructions for this plate closely.

a centre and a radius equal to CD, describe an arc cutting at I; join FI and IH, when you have constructed your parallelogram.

Problem 3.—To inscribe a square in a circle:

Draw the circle, as shown, 3 in. diameter; draw next the two diameters AB and CD at right angles to each other; join these points of intersection with the circle, and you have a square completed as shown.

Problem 4.—To inscribe a regular pentagon in a given circle:

Draw the circle as shown 3 in. diameter; draw the two diameters AB and CD as before; consider the centre of the circle as the letter O; bisect OB as shown at E (note: your previous plate gave this problem of bisecting a line). With E as a centre and EC as a radius draw the arc CF, cutting AO at F. With C as a centre and CF as a radius, draw the arc FG, cutting the circumference of the circle at G. The chord GC is one side of the pentagon. The rest of the construction is left to the student, for it is self apparent, the one side being obtained.

Problem 5.—To describe a regular octagon in a given circle:

With O as a centre describe a circle 3 in. diameter; draw the two diameters AB and CD, bisect angle AD at E, and sides as shown at 1, 2, 3, 4, 5, 6 and 7. (Of course this can be any number). Now draw a line through points E and 2, cutting the circle at F; draw the chord CF; this is one of the sides of the polygon. Of course the others are easily obtained by spacing off around the circumference.

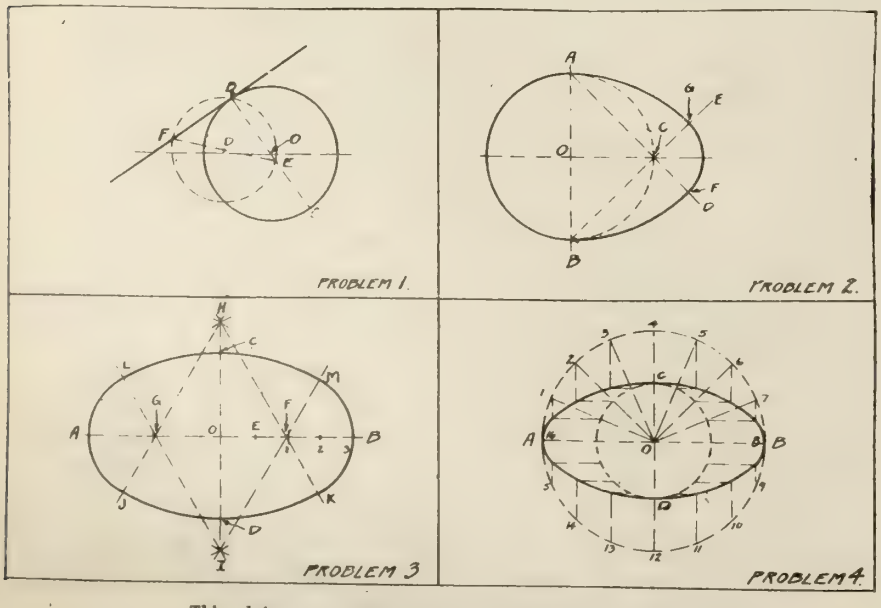
The Second Plate

Th same instructions hold good in the laying out of the plate shown at Fig. 3, and Problem 1:—To draw a line tangent to a circle at a given point on the circumference is started as follows:—

With O as a centre, draw a circle 2½ in. diameter. Assume a point B on the circumference, and join B with O. Now construct a perpendicular to BO in the following manner: Produce the line BO to C. Choose any centre D and describe a circle of such radius that it will cut through point B. Where this circle intersects with the line BOC call by the letter E. Join E and D, producing it out to F. From F draw a line to B, and produce the same out beyond the circle as shown. This line will be tangent to the circle first made.

Problem 2: To construct an egg-shaped oval: From a centre O, with a radius of 1½ in., describe a circle. Through the centre O draw AOB, also a line OC perpendicular to AOB, cutting the circumference of circle at C. Draw the straight lines AD at BE. With A and B as centres, and the distance AB as a radius, describe arcs terminating at F and G. With C as a centre, and CF as a radius, describe the arc FG, when you now have the egg-shaped oval complete.

Problem 3: To draw an ellipse by circular arcs.



Such an ellipse is not a true ellipse, but suitable for many purposes.

Draw AB 4½ in. long, CD 3 in. long. On the major axis AB, make AE equal to CD, then divide EB into three equal parts. With O as a centre and a radius equal to two of these divided parts, describe arcs cutting at F and G. With FG as a side, construct two equilateral trinagles FGH and FGI, and continue these lines as shown. With H as a centre, and a radius HD, describe the arc, cutting at J and K. Then with the same radius, but with I as a centre, describe a similar arc, cutting at L and M. With A and B as centres, and a radius equal to the chord of the arcs AJ or BK, describe arcs, cutting AB near the points F and G. From these new points of intersection as centres, and with the same radius, describe the arcs JAL and KBM. Your ellipse is now complete, although, as said before, not absolutely accurate.

Problem 4: To construct an ellipse by the exact method, the diameters being given.

Let AB be the major axis 3½ in. long, CD the minor axis 2¾ in. long. With O as a centre and OD as a radius, describe a circle. With O as a centre, and OA as the radius, describe another circle. Divide each circle into a smaller number of parts, the more parts, the more accurate the ellipse. For our purpose we will say 16. This is best done by dividing the larger circle into 16 parts, then drawing radial lines into the centre as shown on the top portion of the drawing. Through these points of division on the inner circle draw horizontal lines and through the points of division on the larger circle draw vertical lines, the points of intersection being the points on the ellipse. Trace a curve through these points, placing an irregular curve on them in such a manner that its bounding points will pass through at least three intersection points. Be careful not to make your curve too flat. Then adjust your curve from time to time until the figure is completed. It requires considerable practice to draw a good curved line by this method, and readers would do well to practice this problem on a separate piece of paper before putting it on the plate. The neater the work, the better looking the curve, and a great deal depends on the student's taste and accuracy of eye.

This is as far as we need go in geometrical drawing for the purpose of our course, and the next part, which will appear two weeks from present date, will be on an entirely different subject, so keep your eyes open, and be ready to continue the study of mechanical drawing.

This plate may seem easy, but remember that accuracy counts.

Japanese Coal Production

The coal market in Japan remains inactive and there is little or no hope of a revival in the near future. Quotations at present show a decline of about 30 per cent as compared with the average price of last year. The total quantity of coal brought over from last year was 1,478,000 tons, and in April an agreement was reached among mine owners of Kiushu, Hokaido, and the Joban district to restrict the output. The average monthly output in the country last year was 2,250,000 tons, while during the first four months of this year it was 2,128,000 tons. The total output during 1920 was 27,020,080 tons, the figures showing a decline of 4,234,000 tons as compared with the preceding year. In 1919, when the market experienced a boom unprecedented in history, the output amounted to 31,271,000 tons, this being a record for 30 years.

The Imperial Oil Co's plant at Imperoval, near Halifax, caused great excitement a few days ago when several explosions occurred. Some expected a repetition of the disaster in 1917, but it was found to be some pressure stills which caused the trouble. The loss will be about $40,000.

How to Make the Most out of High Speed Steel

Steel Must Be Heated Uniformly—Tools Should Not be Hardened Direct from the Forging Operation—Should be Annealed—Preheating is Important—Tools Must be Properly Ground

By A. J. WILSON

HIGH speed steel is of vital importance to all lines of manufacture, for there is no manufacturing concern that is not more or less interested in the use and conservation of tools and tool steel. This applies more especially to the automobile or automobile parts manufacturers whose tools, particularly high speed tools, are a very large item of expense.

During the war when the price of high speed steel was very high, we were awakened rudely to the fact that we were using this material in an extravagant manner. As production of war material was the important demand at that time, the only alternative was to buy more steel as needed. But we also got busy to find some means of making this high priced steel stay on the job longer and to do more work while it was on the job.

As it was necessary to have a starting point, this was made at the blacksmith forge. Due care was taken that heats were satisfactory when the forging was done. One point that the forge man must make certain is that his steel is heated through uniformly. The outside may be up to forging heat and the inside many degrees cooler. The effect of this can be appreciated readily if a piece of steel in this condition were to be put under the hammer. The outside being softer than the center would prevent the hammer blows from displacing the metal in the center of the piece, therefore it would cause a number of small ruptures which undoubtedly would cause trouble in hardening.

No tools should be hardened direct from the forging operation, but should be annealed before hardening. To save time this may be done by heating them to about 1650 degrees Fahr. in the forge fire and then burying them in ground mica which for convenience can be kept in a cast iron box near the forge. Air slacked lime also will answer the same purpose.

Preheating

After being annealed the tools are ground before hardening, so as to have the least possible amount of stock to remove after the hardening operation. In hardening high speed steel the advantages derived from proper preheating cannot be overestimated. Preheating to 1450 to 1550 degrees Fahr. in a slow furnace and then bringing the heat up quickly to 2250 to 2300 degrees Fahr. in another furnace generally gives satisfactory results. Although in the case of an intricate tool which is liable to crack, better results may be obtained by two preheats, one about 1450 degrees, another about 1750 degrees Fahr., and from this placing the tool into the hardening furnace. Handling the tool in this manner, the shock of being transferred to hardening temperature is not so great and aids by not causing quick expansion of the thinner sections which naturally heat the more rapidly.

The supposition that any fire is good enough for a preheat is erroneous, because the same care must be exercised in running a furnace for preheating as for final heating if best results are to be obtained and the tool is to come out free from scale. Tools must not be allowed to soak in the preheating furnace.

As a quenching medium, fish oil, a standard soluble quenching oil or coal oil will give good results. Coal oil is a little more drastic and it must be used with some caution on account of its inflammable nature. For turning tools, boring tools and the like, where points only are hardened and a little scale does not matter, an air blast will be found satisfactory provided that the air is free from moisture.

During the past few years much experimenting has been done in tempering or drawing back of high speed steel tools and it is along this line that the most improvement has been made. Drawing back has been a common practice for years but not to the extent that it is now carried on. It has been found that steel of standard make when properly hardened, using as high a heat as can be used safely, then drawing back to 1050 or 1100 degrees Fahr., will give its best service. This applies more directly to tools doing extremely heavy work and those required to remove a large amount of metal. The tool is tougher and stronger, still retaining its original hardness, and is not given to crumbling on the cutting edge.

With tools required to give a smooth finish and take a light cut, drawing at so high a temperature is not recommended but a draw of approximately 425 degrees Fahr. in oil has been found to give satisfactory results. A tool drawn at this temperature will retain a keener cutting edge on light work than one drawn at 1000 degrees Fahr. Drawing through the intermediate temperatures, that is between 425 and 1000 degrees Fahr. has not, to the writer's knowledge, ever been productive of any marked degree of success. In fact if it were found necessary to draw a tool made of high speed steel beyond 500 degrees Fahr., it is preferable to jump to the upper range. A chart put out by a well known maker of steel gives some very valuable information in regard to high temperature drawing. This chart gives 800 degrees Fahr. as the point at which the greatest softness occurs.

Before being put to work tools must be properly ground, care being taken to avoid drawing temper or checking. It is customary to use a dry wheel which should be free cutting and true. If water is used sufficient must be used to keep the tool cool as alternate heating and cooling is very conducive to cracks or small checks which will cause trouble later on.

An occasional bar of steel will contain a pipe or seam. This can be determined easily by the appearance of the crack in the hardened tool and if the bar of steel from which this tool was made is examined, the seam or pipe generally can be discovered without much difficulty. Such a bar is practically worthless, but such cases are rare and most of the failures in tools can be laid at the door of the men who handle the steel after it is in the manufacturing plant. In other words, there is much more trouble due to faulty methods of handling than to defective steel.

Getting the Most Out of the Tool

Now that the tool is ready for use how can we get the most out of this tool? In using the term tools we are referring to tools for removing metal such as are used in turret lathes, screw machines, engine lathes, etc. In the writer's company there is employed a man whose title is "Turning Tool Supervisor," his duty being that of providing the workmen with proper turning tools.

It might be well to mention at this time that 90 per cent. of the work is performed under what is known as the straight piece-rate system. Any one

THE VALUE OF STEEL

Without steel, especially high speed steel, the present rates of high production could never have been attained.

Steel, however, requires careful treatment if the greatest good is to be secured from it, so that the hints contained in the present article should be of interest.

In welding high speed steel and carbon steel, one peculiarity arises which must be overcome. The tendency is for one to heat faster than the other owing to the difference in resistance. By allowing one to project further from the holding die than the other until they seem to heat evenly, this difficulty can be overcome.

connected with manufacturing where a bonus or straight piece rate is in effect, knows from experience how essential it is to keep workmen supplied with proper tools. The average man working straight day rate will find little fault with his tools if they are not of proper shape and right hardness. He will probably reduce his feed and speed to the point where they will stand. Put this same man under one of the above mentioned methods and if tools do not stand up he will soon be heard from.

Some time back, this problem confronted our company and after consideration it was decided to appoint some one man whose duty it would be to furnish the workmen with tools properly forged, hardened and ground. By this arrangement a saving on tools was effected and production was increased between 15 and 20 per cent. One of the foremen was selected for this new position and he had a man's size job, for in a shop where this method has never been tried it cannot be accomplished over night. One of his first problems was to gain the confidence of the workmen. Second, he was compelled to sell them the idea that a certain new shaped tool would do the work as well or a little better than a certain shape of their own pet idea. It is also a well known fact that no two workmen will grind a tool alike but this was overcome by using a mechanical tool grinder.

For tools larger than ¾ x 1 x 8 inches it is advisable to use shanks of higher carbon. Our experience in welding heavier tools has been quite limited, but we have been informed by good authority that steel containing 50 to 60 per cent. carbon is satisfactory for welding onto heavier tools up to 2 inches square, such as tools used on large planers, boring mills, wheel lathes, etc.

The value of a solid high speed steel tool of the size just stated, is as follows. One piece ¾ x 1 x 8 inches weighs approximately 1.7 pounds and costs about $1.00 per pound or $1.70. To this we add cost of labor plus 50 per cent overhead as follows:

Forging	$0.10	
Grinding	.05	
Hardening	.04	
Total labor		.19
Overhead		.095
Price of steel		1.70
Total cost of tool		$1.985

This is practically $2.00 for a small tool ready to be put to use. Of course the labor figures are only approximate, but will come very close to actual cost, and the overhead will vary in different plants.

Now let us find the cost of a tool of the same size, one half high speed steel and one half carbon steel. One piece of the high speed steel ¾ x 1 x 4 inches weighs 0.85 pounds which at $1.00 per pound represents $0.85. One piece of carbon steel of the same size, weighing about 0.80 pounds at $0.07 per pound represents $0.056. Further costs are as follows:

Cutting off carbon steel from bar	$0.01	
Welding	.015	
Annealing	.03	
Forging, hardening and grinding	.19	
Total labor		.245
Overhead		.12
High speed steel cost		.85
Carbon steel cost		.056
Total cost of tool		$1.271

From these figures we find that whereas our tools of solid high speed steel cost $1.985, we can produce a tool of one half high speed steel and one half carbon steel welded on which answers the same purpose for $1.271 with a net saving of $0.714.

Now let us see how cheaply we can produce a first-class tool from scrap formerly sold at $0.10 per pound, that is a tool of the same size worn down to 4 inches in length or too short to hold in a tool post. The cost is as follows:

Cutting off forged end of worn tool	$0.015	
Grinding end square	.01	
Electric welding	.015	
Annealing	.03	
Cutting off carbon shank	.01	
Forging, hardening and grinding	.19	
Total labor		.270
Overhead		.135
Cost of 0.85 pounds high speed steel at $0.10 per pound		0.85
Cost of 0.80 pounds of carbon steel shank at $0.07 per pound		.056
Total cost of tool		$0.546

Thus we find that we have the following results:

Tool made from high speed steel	$1.985
Tool made from one half high speed steel and one half carbon steel	1.271
Saving	$0.714

Now we have produced a tool by salvaging for $0.546 with a direct saving of $1.439 over a solid tool of high speed steel, also a saving of $0.725 over a tool welded up from a piece of steel representing 100 per cent. value.

One peculiarity arises in welding high speed steel and carbon steel, that must be overcome, and that is; one will heat faster than the other owing to the difference in resistance. This will occur in any two pieces of metal that are of different composition. This is overcome by allowing one to project further from the holding dies than the other until they seem to heat evenly to a plastic heat, then they are pressed together. The amount that they must differ in length to get proper heat at welding points can only be determined by experimenting.

As soon as the welding is accomplished they must be annealed. This is best accomplished by placing them in a hot furnace, holding them at a good annealing heat for an hour or more, then letting them cool down slowly in the furnace. If a piece of high speed steel and carbon steel when welded together is allowed to cool in the air, one will cool quicker than the other, and as contraction takes place during cooling it is bound to set up a strain in the weld which will cause it to crack. This will be true five times out of ten, thus it does not pay to take any chances. Tools properly welded and annealed can be forged successfully and it is our experience that less than 0.5 per cent. break in forging.

In placing these tools in service, precaution should be taken to see that the bed of the tool post is level and smoothed where the tool is clamped down or it may be broken in this way. This is equally true of any high speed steel tool that has been hardened all over.

The habit of workmen in striking a tool with a hammer when it is necessary to move it cannot be condemned too strongly. It is much better to take a little longer, relieve the tool and reset it, as a broken tool costs money and time and produces nothing but waste.

In conclusion, the price of success is eternal vigilance. Workmen, as a rule, do not take interest in the use of tools, and the practice of economy as that shown by the man who is responsible for the success of the department or the man who pays the bills, but much can be done along the line of educating machine operators in lines of careful handling of tools. They must be taught that every direct loss sustained by the company is an indirect loss to every individual.

LARGE DOCK

The extension recently completed to the Royal Albert Dock on the Thames forms the most costly single work ever undertaken to improve the facilities of the port of London. Over four and a half millions were spent on the extension, which adds a water area of about 64 acres and provides about two and a half more miles of quay. Construction was begun in the year 1912, and was maintained on a limited scale throughout the war. The working depth in the dock is 38 feet so that the largest class of vessel using the port can be accommodated. A prominent feature of the dock is a double bascule bridge carrying a roadway. Each leaf weighs 368 tons and the bridge opens in sixty seconds. An elaborate equipment of electric cranes has been provided, together with every facility for the rapid loading and unloading of vessels. Since its opening by the King and Queen this dock is known as the King George Dock.

The Oliver Machinery Co., Grand Rapids, Mich., have issued a "Manual Training" bulletin. It shows machines often used in various schools throughout the country, and illustrations of such manual training departments are shown.

WHAT OUR READERS THINK AND DO

GOVERNMENT WORK

By H. T. Osborn

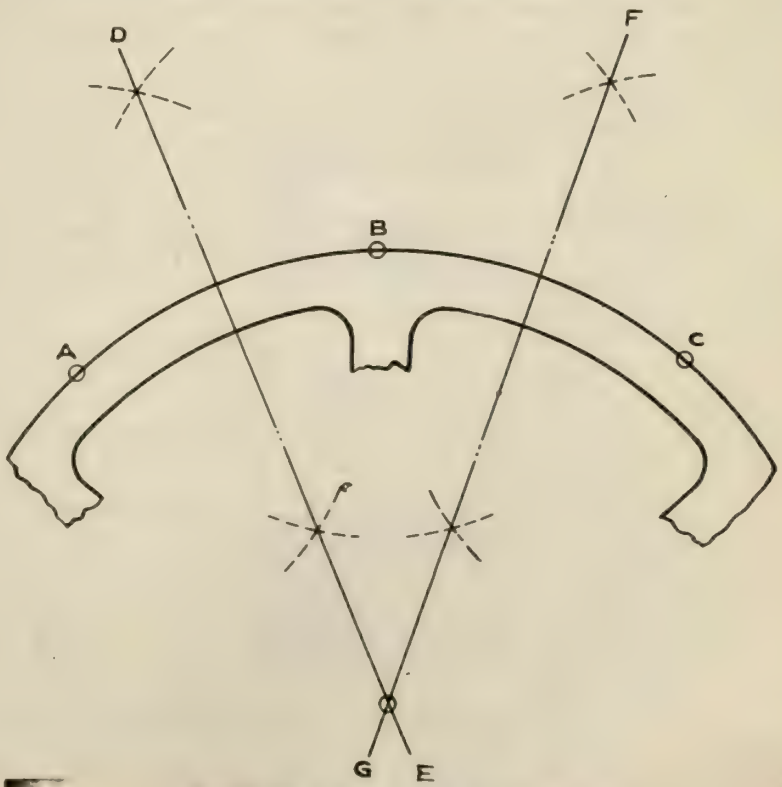
In the September 8 issue of Canadian Machinery appeared a letter and editorial on the subject of "Government work." Mr. Osborn, another of our readers, feels he should get into the controversy, and here is what he says.

"Regarding Mr. Homewood's letter and your editorial; The point at issue seems to be whether a man should be penalized for the offence. As the practice is a dishonest one, there can be no justifying it, but at the same time, who is to condemn? Is there anybody without sin who shall cast the first stone?

In my own experience of shop life I do not remember meeting the man, be he manager, superintendent, foreman, or other employee, who could convince me that he has never acquired something, however small, at the unwilling or unconscious expense of somebody else. That he has never "knocked out" a job for himself, or would not succumb to the temptation to do so if in need of said job with the opportunity at hand.

To my mind this applies to the employer who in most cases rose from the ranks of labor or inherited his position from somebody who did. "Government work" is only one branch of the crime of disloyalty to one's employer. There are other branches more or less paltry in themselves, but still having the same effect to a certain extent. It is no unusual occurrence in most shops for the manager to show personal friends round during business hours. To the man in the shop the real business men can usually be picked out from sightseers. It this a special privilege, or is the manager wasting the company's time? In a shop I would like to speak of, it is strictly prohibited for any outsider to enter the place for any other purpose than business. Yet we often had the pleasure of seeing the lady friends of the management around.

The superintendent of this particular concern has a motor cycle which would cost him a ruinous sum, annually, for repairs were it not so convenient to bring in an odd part frequently. Many are the "Government jobs" I have been called upon to do in this way, and they were usually too small to charge time on. The foreman got away with more of this stuff than I ever saw anybody do, spending hours at a time at it, and would think he had a perfect right to take a man off a machine to use it himself, thereby stealing two men's time. I could truthfully cite many instances of dishonesty along these lines, but it is needless to do so. This person I speak of, however, was always on the lookout to see that none of the men did other than their duty. He was very considerate of the firm in this respect. How in such circumstances can anybody condemn the man in the shop. Not that it can be justified, as two wrongs cannot make one right.



The evil seems to be universal. Even the writer of the editorial admitted his guilt. The evil cannot be abolished by making an example of somebody. An easy way of avoiding the loss, however, would be to allow employees a certain amount of freedom to do their odd jobs in their own time, making a rule, say, as follows:—"Any employee wishing to use the machinery for a short time after working hours, may obtain permission from the foreman. Cost of power, and any material used to be paid by user." With a rule such as this, there are few men who would bother with any private job in working hours, when they could do it in a convenient and honest way. Then with a virtuous example set by those in authority plus the above scheme, the employer who is robbed is indeed a martyr.

BROKEN SECTIONS

By John Hope

I noted with interest the article in July 7th issue of Canadian Machinery, which gave in panel form, a formula for finding the diameter of any broken section. The sketch attached shows another method which has found favor, and is very easily remembered.

Place the broken radius section on marking table having it rest on a sheet of paper. Define a clear line of the broken part, after which select three points A. B. and C. as shown. Describe arcs from these making them cut each other. Where they intersect draw the lines D. E. and F. G. Where these lines meet will be the center of the circle, that is, relative to the broken section. For shop purposes this method is found to be close enough except where the broken section is very short, not allowing enough space between the three trial points.

Showing the author's method of figuring section.

TWO TAP HOLDERS

By Harry Moore

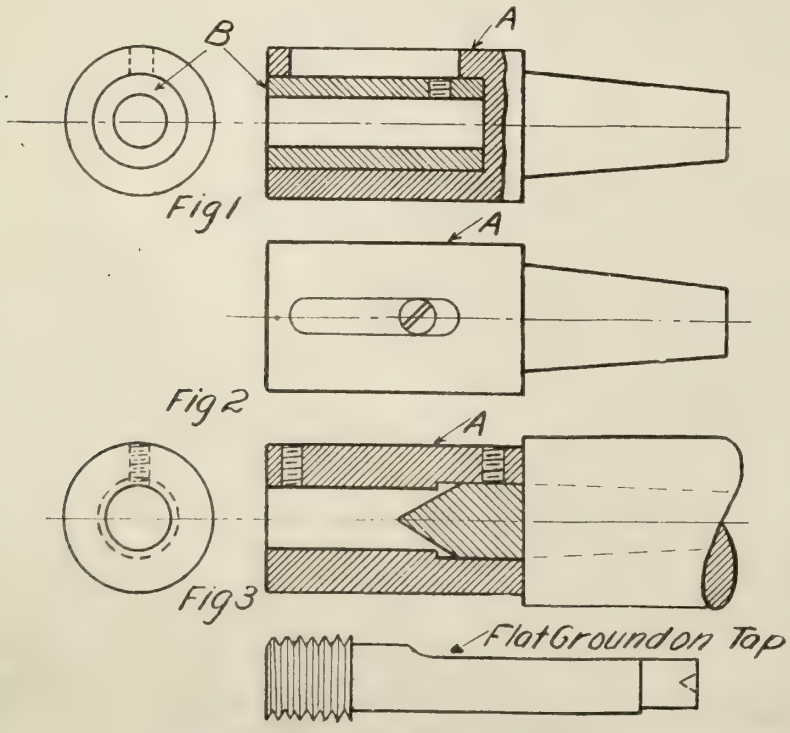
An engine lathe tailstock is anything but an ideal device for tapping, yet in the smaller shops there are occasions where it must be used. The difficulty is the following up of the tap when started. Following are shown two methods which I have adopted with good success.

At Fig. 1 is shown a solid holder which is turned on the shank to fit the spindle taper, and is bored at the front to take the sleeve B. The holder is slotted as shown at Fig. 2. When the tap is held in B, it is tightened with the screw C, this screw extending up to the top of slot A. When the tap begins to travel forward the sleeve B slides forward in A, and if the thread is short enough the tailstock spindle need not be advanced at all.

In Fig. 3 the holder fits over the centre and is better adapted for work that requires the use of the centre at some point of the operation. The piece A is bored out to fit the centre, a pointed screw is used. A hardened screw with a flat end threads into the front of A, this tightening on a flat ground on the tap shank. When the tap is in the holder the short screw is adjusted close to the flat, not tight, but leaving it free to slide back and forth. A second short screw is then tightened on the hardened one, locking it in position.

HARDENING AND TEMPERING

By George Russell



Although some people still claim that the process of hardening and tempering of tools is a trade secret the machinist is often called upon to understand such work. Some mechanics have the idea that the art of hardening is just a matter of heating a piece of steel to a cherry red and plunging in water, but, it is far more important than that. We take a piece of steel and put it through a process of careful machining and finishing, then bring it to the last and most important operation of all, and one on which the success and value of all the other operations entirely rests. To be successful in hardening the mechanic should use good judgment and should find out what particular quality is needed in the piece to be hardened, whether toughness, extreme hardness, elasticity, or a combination of these is needed.

He must know the methods to use to produce the required results. He must take into consideration the shape of the piece, the nature of the steel, and the use the article is to be put to. He should avoid heating the piece hotter than is necessary, and if compelled to use a blacksmith's forge, and the piece is larger, he should use a high fire keeping the piece well from the blast inlet, using only blast enough to keep the fire lively and to bring the piece to the proper heat. The part should be buried well into the fire to keep it away from the air. The strain should be taken out by reheating as soon as possible after immersion in the bath.

Any steel to be tempered should first be machined or ground as the skin gives false colors. Let us consider a few articles to be hardened in the blacksmith's forge. If a counterbore tap, or other similar article is to be hardened it is best to heat in a tube. A tap is required to be softer on the shank than on the teeth to avoid breaking off when in use, so that after the tap is hardened, obtain a pair of round tongs long enough to grip the whole of the shank, and a piece of iron pipe a little larger than the tap. Heat the tongs to a bright red and use them to bring the color down. In the meantime the pipe is heated to a cherry red, and as soon as a straw color appears on the shank from the heat off the tongs, the tap is placed in the pipe up to the ends of the thread. This will keep the color back on the threaded part and the shank will be a dark blue by the time the threads have reached a dark straw, then plunge into the water.

In hardening bushings for jigs, etc., never hurry the work. Heat evenly to a cherry red and plunge in water which has the chill removed; then reheat until it will snap to the moistened finger. From then on leave in the air to cool.

In hardening counterbores, or such tools where a pin or teat is employed as a guide in the hole, it is necessary that the pin or teat working in the hole should be much harder than the cutting surface. First harden the tool, being careful when dipping to avoid cracking. In tempering, heat the tool on a piece of red hot iron, and as soon as a pale straw color has come down to the pin, keep it in that place by pouring a stream of oil upon it while the color comes down on the main part of the tool. When the color has reached the desired shade then plunge in water.

Showing the style of tap holders.

PAINT SPRAYING MACHINES

Tests carried out on paint-spraying machines have shown that spraying requires approximately 10% more paint than brushing when the surface being treated is an iron roof, while brushing requires approximately 200% more labor than spraying. Exterior brick wall spraying requires 7% more paint than brushing, while brushing requires 109% more labor than spraying. On interior ceilings and walls of plaster spraying requires 40% more paint than brushing, but gives a better hiding in one coat. On similar work brushing requires 160% more labor than spraying, and gives a poorer hiding in one coat. Although it has not been possible as yet to arrive at a definite conclusion confirming the relative durability of spraying as compared with hand painting, it is claimed that the investigations so far made tend to support the belief that the spraying work will last longer. —Mechanical World.

CONCRETE MASTS

The Japanese Government is building a powerful radio station at Tokio. A feature of this installation is the reinforced concrete tower for supporting the aerial. The tower is 672 feet high, and of a round, tapering form. It measures about 50 feet in diameter at the base, and about four feet at the top. The structure is hollow, of course, with reinforcing bars throughout. The center hollow of the concrete tower is occupied by a steel stairway, which gives access to a balcony near the top, and to four other balconies. The tower was cast by means of a central framework of wood and outside wooden molds, which were shifted upward as the casting progressed.

Saving the Steel Stack

THE CONSERVATION of self-supporting steel stacks which have corroded to the danger point, by incasing them with concrete, has become a well established practice. "Scientific American" tells of a firm in Chicago who could not afford to shut down their plant, although the steel stack in place was in very bad shape, so it was decided to use the cement-gun in reconstructing the stack. By coating the outside with reinforced cement-gun concrete, a new self-supporting stack has now been built upon the existing foundation.

This steel stack was 175 feet high by 9 feet diameter. A reinforcing network of sufficient strength to make the new stack self-supporting without any help from the existing stack was built up of rods and wire mesh and secured to the existing foundation bolts. A cement-gun was then used to shoot gun-crete or gunite, as it is variously called, through the reinforcing mesh against the existing steel shell to the required thickness. A mixture of sand and cement hydrated in the nozzle was applied with an air pressure of about 35 pounds. The gun-crete is 18 inches thick at the base, tapers rapidly to 6 inches just above the bell base and then gradually decreases to 4 inches at the top.

The cement-gun remained on the ground. The dry mixture of sand and cement was blown through the hose by air from a compressor working at about 50 pounds pressure. Water was forced through the water hose of relatively small size but considerable length and at a pressure great enough to give a pressure at the nozzle in excess of the air pressure. The operator worked upward from the bottom, finishing as he went, so that at the end he was 175 feet above the gun and material was forced up to him at the nozzle at that point.

All the work was done without interrupting the use of the stack. The gun-crete was applied when the stack was too hot to permit holding the hand against it. The breeching extending from the side of the boiler house to the stack was also encased with 3 inches of gun-crete while it was so hot that water thrown against it boiled. The gun-crete was kept thoroughly sprinkled until set. The effect of the hot stack seemed to be that of steam curing and after being in use for nearly 3 years the gun-crete is everywhere sound and shows no cracks.

A Grinding Incident of Note

A HARDENED steel ring, gauge 1 in. long, was recently ground and lapped out at the National Physical Laboratory in England until the internal diameter, was 1.0000 in. The outside diameter, which was 20-in., was ground true. A plug gauge was ground and lapped down until it could be inserted into the ring, using ordinary hand pressure, and with both gauges clean and free from any trace of grease. The size of this plug was found on measurement to be 1.0000-in. A second plug was then made whose diameter was 1.0002-in. This plug refused to enter the ring so long as the surfaces were kept dry and free from grease, but when lubricated with vaseline it was found possible to assemble the two gauges by ordinary hand pressure. By measuring over its outside diameter both before and after the plug had been inserted, it was definitely proved that the ring had been stretched in the process of inserting the gauge.

An Amphibious Vessel

A STRANGE vehicle has been designed by M.Leon Foenguinos, in Marseilles, France. Speaking about this new invention "The Managing Engineer" says that the hull is of an unusual shape and armoured. The method of propulsion on land is by caterpillar wheels of a new type, which enable the vessel to manoeuvre in deep mud and thick sand, such as are found on river banks and on the seashore. The hull is everywhere water-tight, and at the stern is a three-bladed screw with an average speed of 800 revolutions. Both caterpillar wheels and screw are driven by a 30 horse-power motor in the interior of the vessel.

On land the vessel is guided by a steering wheel as if it were a motor car; it is, moreover, fitted with a three-speed gear, and can be driven backwards. On the water it is steered by means of a rudder, the wheel of which is placed near the pilot. It is thus very easy to drive, as to leave the land all that is necessary is to steer the vessel towards the shore where, advancing into the water by means of the caterpillar wheels, it floats as soon as its displacement is equal to its total weight. The amphibious vessel has been designed to fill many uses. As a means of transport across tracts of wild country where rivers and swamps are to be crossed, it would prove useful.

Its inventor also believes that it might be used as a lifeboat on board ship, as it cannot be swamped. An armoured type can be made to serve as a land and water tank for attacking purposes. The inventor, we are told, hopes shortly to be able to introduce a modification which will enable his vessel to navigate a few feet below the surface of the water as well as on the surface.

* * * * *

Protecting Against Fire

AFTER having several accidents resulting from the use of gasoline in open containers, the Bosch Magneto Corp. decided to develop and use a gasoline washstand that would be perfectly safe. The result of their research work is told in a recent issue of "Factory."

The stand is built up of angle iron with a sand box on top and a compartment for gasoline and kerosene cans at the bottom. The working space is in the centre, about the same height as the average work bench from the floor up. The upper compartment is filled with sand, which is held arrested by two trap-doors supported by a lever on each side immediately underneath the trap-doors. The long ends of the levers are connected with a string of gun-cotton. Should the gasoline become ignited through some accident, the gun-cotton string will immediately burn through, thus releasing the two levers and opening both trap-doors, releasing the sand and smothering the flame. At the same time the sliding door in front will move upward, confining the flames inside of the compartment. The adoption of these stands has reduced insurance rates, and they have been a subject of much praise from insurance underwriters and state inspectors who have had occasion to visit the factory.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Eighteen readers submitted correct lists for the Sept. 8th contest. We were simply swamped with lists of answers, and after the elimination test, Lewis W. Munsie, New Glasgow, N. S., and Jas. Hunter, Hamilton, Ont., were the lucky ones. Mr. Munsie is engineer with the Eastern Car Co. while Mr. Hunter is superintendent at the Hamilton Bridge Works. In another portion of this issue are the names of those who also sent in correct lists, but unfortunately did not win out in the elimination.

CONTEST FOR SEPT. 29TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1 A large item in labor cost. How to save money.
2 Something Canadian which is exclusive.
3 How to lift a load in half the usual time.
4 Something that is convincing.
5 How to overcome boiler and engine room repairs.
6 A product that is not limited to work of special nature.
7 A case where everything is tested.
8—How to prolong the life of your machinery.
9—Something that is raised and lowered by power.
10—How to avoid loss of power.
11—Something that started in 1856.
12—Two important things to consider.

These are Correct Answers for List from September 8th Issue.

1—Pratt & Whitney Co. of Canada.
2—The National Acme Co
3—Dominion Engineering Works.
4—Taylor Instrument Co.
5—Canadian National Carbon Co.
6—Armstrong Bros. Tool Co.
7—Wallace Barnes Co.
8—Brown & Sharpe Mfg. Co.
9—Dennis Wire & Iron Works Co.
10—The National Acme Co.
11—Roelofson Machine & Tool Co.
12—Dominion Oxygen Co.

Closing Date for This Contest is October 20th

DEVELOPMENTS IN SHOP EQUIPMENT

COMBINATION MACHINE

The Dalton Mfg., Co., Sound Beach, Conn. have brought into the market a combination machine which is primarily intended for use in garages, on shipboard, and in other places where a rather complete equipment is required and floor space is at a premium. The machine can be used as a lathe, drilling, or milling machine, and a single hollow spindle serves both the lathe and the milling machine. It has a No. 10 B. & C. taper hole in the lathe end. The lathe swings 13 in. over the shears, and will take 37 in. between the centers. By removing a section of the shears next the headstock, it becomes a gap lathe, capable of handling faceplate work 18½ in. in diameter by 6½ in. long. The block is held in place by a tapered dowel bolt, and may quickly be removed or replaced.

The cross-slide has a travel of 12 in., and is fitted with a compound rest. The head has a three-step cone, and is provided with a single back gear, giving a speed range from 20 to 441 revolutions per minute. The lead screw is 1 in. in diameter, and has an 8-pitch Acme thread. Change gears are provided to cut all standard threads, including 11½, from 3 to 56 per inch. Gears for metric threads can be supplied.

The milling machine table has a working surface of 24 by 7½ in., and a longitudinal feed in either direction of 15 in. The transverse movement is 6¼ in., and the knee can be adjusted vertically through a distance of 13¼ in. A telescopic elevating screw obviates the necessity for boring a hole in the floor.

The drill press can be used only by removing the overarm of the milling machine. A round table is furnished, to be attached to the table of the milling machine. The machine will drill to the center of a 16-in. circle, and the spindle has a vertical travel of 9 in. The maximum distance from the end of the spindle to the milling machine table is 23 in. With the round table in use this distance is 18 in. The spindle can be locked rigidly in any position of its vertical travel, and it then becomes a vertical milling machine, having all the movements of a standard machine.

While the lathe and milling machine, or the lathe or drill press, may be used simultaneously, the tool is intended as a one-man machine. It can be set up on a floor space of 40 sq. ft., including the room necessary for the operator to get around it.

NEW SERIES OF VISES

The Chas. Parker Co., Meriden, Conn., placed on the market a short time ago a new series of vises. The new line embraces seven sizes in both the stationary and swivel types, ranging from 3¼" to 7" jaws. The castings used are of increased strength and are made from semi-steel, and the solid steel bar slide strengthener embodied in these vises is a patented feature which is said to strengthen the weakest part. They have also a patented swivel base which is well worth attention, together with various other features.

NEW TYPE DRILLING MACHINE

A gantry type of drilling machine has been developed and marketed by W. K. Stanets, Jenkins' Arcade Building, Pittsburgh, Pa. This machine is said to be very useful to those building tanks, steel cars, etc., in fact, where it is required to drill holes near the centre of large steel plates.. There is not a sufficient demand for machines of this type to justify the making of any standard size or style, but it is stated that the design of this machine lends itself to the uses intended of it, and it is the practice to build each machine to meet the requirements of the shop in which it is to be used.

TOOL FOR MEASURING SPEEDS

An instrument devised for measuring the cutting speeds of machine tools of all kinds has been placed on the market by a New York concern. This instrument gives direct readings without any timing or calculating, on a dial, which is graduated to record all high or low cutting speeds of lathes, milling machines, planers, and drills. In operation, the instrument is held by a handle so that a friction wheel at right angles to the handle is pressed against the object whose motion is to be measured, and the dial, which is at the end of the handle, faces the operator. The friction wheel can be replaced by a pointer, such as is used on all tachometers, and the instrument then records revolutions per minute. The device is also used for recording the speed of rolls, belts, ropes, etc.

Where The Remedy Lies

IN ANOTHER portion of the present issue appears a letter on the subject of "Government Work." Mr. Osborn, who is the author of the letter, brings out some interesting points, but unfortunately he seems to have missed the message in our last editorial, viz., that the only way to stamp out this evil is for the workers themselves to discourage any attempts at it. Mr. Homewood complained of hounding a man for such an offence, while Mr. Osborn uses the term penalizing. There is a vast difference between the two words. To hound a man is absolutely unfair, but to penalize him is quite within an employer's right.

Take for example the superintendent with the motor cycle which Mr. Osborn speaks of in his letter. First of all we will grant that such a case is not unusual, but does that make the offence any lighter. Of course not, and in such a shop we could hardly blame men for trying their hand at odd jobs for themselves, yet the fact remains the same that many wrongs do not make a right. If the management of the firm which Mr. Osborn speaks of, was on the job, such a foreman would have to find a position elsewhere. It matters not whether the "Government Worker" be foreman or ordinary employee. If he is working for himself in his master's time, it makes the offence the same. The fact that this particular foreman watched, and refused to allow his men the same privilege as himself, showed that he knew it was wrong, and his selfish and one sided conscience was the only thing that saved him.

As far as Mr. Osborn's point of showing personal friends through the shop is concerned, this is something that should be avoided as far as possible. There come occasions however when the showing of friends through a plant is quite permissible. Suppose they have come quite a distance, and wishing to show them the business he is building up, the owner proudly pilots them around. Whose business is it but his own? So long as he does not interfere with the shop production it matters not whether any of the sightseers ever visited such a plant before. Although we do not believe in the habit, as a habit, we at the same time admit it is the owner's own business.

Then again, how can the average workman feel sure that the so termed sightseer is not someone who is vitally interested in the business of the company. He may be a silent partner, or perhaps a gentleman about to place an order of large proportions and who wishes to see the facilities of the plant before finally closing the deal. The situation takes on so many different angles that it behooves one to think carefully before criticizing.

The last suggestion of Mr. Osborn's, to our mind, does not hold water. He suggests the setting apart of a certain time for employees to do their odd jobs in their own time, charging them up for cost of power, material used and so on. How many plants could afford to do this, and how many men would honestly turn in an account of material used, power consumed, depreciation of machinery, etc., etc.? Even conceding the fact that every man would act honestly, what would the article cost when actually completed? Would it be more than the workman could purchase it for? Frankly we believe the latter condition would hold true.

Another point and we close. Suppose a man is making a square, a surface gauge a set of vee blocks, or in fact any small tool. Does he realize that when he is doing so, he is actually taking trade away from brother mechanics who are engaged on such work daily, and who, with the facilities on hand, can make such tools cheaper and more accurately? This is a side of the question seldom considered.

However we must not get away from the main point of the editorial "Government Work," and its danger. Again we repeat that the solution lies in the hands of the employees themselves, and while we do not expect any world wide movement to stamp out the evil, the fact remains that the moment workers stop such a practice, the danger ceases to exist. Human nature seems to be such, that the temptation to do a job for oneself in someone else's time is too strong to resist, so that we can reasonably expect that, like the poor, the government worker will be always with us.

* * * * *

Good Judgment

SPEAKING of the value of education to engineers, Knox Taylor, C.S.C.,president of the Taylor-Wharton Iron & Steel Co., says that an engineer should be educated to know a great deal about a few things and a little about a great many things. Where should the line be drawn? That is the great question. To draw it properly is a matter of judgment, and good judgment is so rare. How much time, money, and even life, is wasted through poor judgment? Too much emphasis cannot be placed on educating to develop good, sound judgment, for without it nothing else avails.

It wouldn't be a bad idea to try the other key.

MARKET DEVELOPMENTS

Market Continues to Show Upward Trend

Steel Business Picks Up Steadily—Machine Tools Are Moving At a Fair Speed—Reductions Are Announced In Two Lines—Scrap Market Still Remains Very Dull

MARKET conditions continue to improve. From all quarters comes a note of optimism. The steel demand is much better this week and business is broadening until at present practically all classes of buyers are into the market. There is a very hopeful tone throughout the iron and steel trade among producers, distributors and consumers. No spectacular improvement is expected, but the feeling is that from now, the improvement will be gradual but steady.

One Canadian manufacturer has announced a 10 per cent reduction on milling and grinding machines, this coming into effect Sept. 23rd. Lower cost of materials and slightly lower wages are the reasons given for the reduction. Machine tools generally are moving, but not rapidly. There are quite a number of enquiries floating around, some of which look like real live orders.

Structural shapes, bars, hoops and items of such nature show a seasonal improvement. Prices are holding steady in these lines. Next week we expect to announce a slight reduction in the price of boiler tubes.

The small tool market still goes along in steady fashion, there being neither change in prices nor a difference in the demand. Scrap metal remains dull as one could possibly imagine. Nobody shows an inclination to buy, and dealers of course refuse to stock up further. With the exception of the scrap metal market, all other lines show increased activity.

STEEL DEMAND IS NOW MUCH BETTER GENERAL IMPROVEMENT IN BUSINESS

Special to CANADIAN MACHINERY.

PITTSBURGH, September 29.—Price movements interfere with an exact study of trend in the volume of orders for steel products. Both wire products and sheets have been advanced in the past week, while tubular goods have been reduced. In wire products and sheets, one cannot tell precisely how much of the improvement in demand was a cause of the price advance and how much of it was caused by the price advance. In each case there were heavy bookings before the advances were made effective, buyers being given notice of prospective advances and an opportunity to cover.

In the case of tubular goods, manufacturers state that the reduction has not had any important effect upon bookings, which have been increasing right along. However, the reduction was not a plain reduction by any means. In the first place, the reduction is computed from the lists of July 7, which were being shaded more or less, so that the actual decline in the market is much less than the announced reduction. In the second place, there were many price guarantees out on pipe, running from two weeks to longer periods, and in such cases there is no instant reduction, the reduction really dating back.

Steel Demand is Better

However, whether one can analyse the steel demand in detail or not, there is no question that demand is increasing in general, as it has been increasing since the middle of July. Business is broadening, with practically all classes of buyers in the market to a greater or less extent, and in their contact with the producers the buyers show that they rate the prospects in their several lines of business much better than they did two months ago. There is now a very hopeful tone throughout the iron and steel trade, among producers, distributors and consumers. The expectation is for a continuous and gradual improvement, not for anything spectacular.

Usually the tonnage of steel ingot production is a good gauge of the demand for steel products in general. At this time it is not as good an index as usual, because the improvement in demand has been chiefly in the lighter and more highly finished products, sheets, tubular goods, wire products and tin plate, while the heavy lines, bars, shapes, plates and rails show little improvement. Accordingly there is not so much improvement in the tonnage of ingots. The rate of ingot production now is about 35 per cent of capacity. This looks like a very low rate, even though it is nearly double the minimum rate, in the fore part of July. In tonnage, the rate of steel ingot production, in round figures, has increased from about 10,000,000 tons to 18,000,000 tons per annum, capacity being about 52,500,000 tons, while during the first nine months of 1920, when demand appeared to be almost unlimited, output averaged a rate of 42,000,000 tons a year, there being restrictions to operation by fuel shortage, labor inefficiency and great transportation difficulties.

Steel Price Movements

The wire advance, reported a fortnight ago, and effective September 12, was $2 a ton on plain wire and cement coated nails and $3 a ton on barb wire, and wire nails, making prices as follows: Plain wire, $2.60; galvanized wire, $3.10; cement coated nails, $2.45; wire nails, $2.90; painted barb wire, $3.05; galvanized barb wire, $3.55.

The advance in sheets, which started with advances by various independents and was completed by the American Sheet and Tin Plate Company (Steel Corporation adopting the new figures, effective at the opening of business September 22) is $5 per net ton, making blue annealed sheets 2.50c., black sheets 3c and galvanized sheets 4c. The new list prices on tubular goods, by the lists dated September 16, 1921, and referred to in last report, are: Standard steel pipe, basing discount, 1 to 3-inch butt weld, black, 68½ per cent., galvanized, 56 per cent; steel boiler tubes, less car loads, 53 per cent basing discount, on sizes 3 ¼ to 13-inch; line pipe, basing discount, 67 ½ per cent, on 2 ½ and 3-inch butt weld.

With two market advances, in wire products and sheets, and one decline, in

pipe, still fresh, there has been practically a stationary market in bars, shapes and plates. One can no longer say that the steel market is declining, and it certainly does not look stationary. It is a serious question, however, whether a general and prolonged advance has begun. The real decline, which was decidedly sharp, practically ended towards the close of July. After that what occurred by way of declines was no more than a gentle sagging here and there. The sheet mills insist that the advanced prices are being strictly held, and that is probably correct, but it is not so certain that, as claimed by some, the market will have another advance. It is pointed out that costs in August were far above even the present advanced prices, but one must bear in mind that costs are lower now. By the bi-monthly adjustment, tonnage wages are down by an average of about $2 a ton, and by the present heavier operation costs are also reduced.

General Business

There is no doubt that there is improvement in business generally. That is important as to the steel market's future and promises further improvement in steel demand, but it is not an explanation of the improvement in steel that has occurred up to date. since that improvement represents simply progress towards a normal relation with general business. Steel demand had been subnormal, on acocunt of stocks that had to be liquidated. With no improvement at all in general business steel demand was bound to improve from the absurdly low level of June and July. In other words, it seems perfectly safe to assert that matter what might happen to general business steel could not go back to its position of last June and July.

Pig Iron and Coke

Inquiry for pig iron has been very light, but a resumption of buying in a moderate way must come soon, as recent purchases were only for very early delivery and practically all classes of buyers are consuming iron at a great rate. Merchant furnaces are gradually resuming operations. Prices show a stiffening tendency, though there have been no actual advances in the past week, the local market remaining quotable at $20 for Bessemer, $19 to $20 for basic and $21 for foundary, f. o. b. valley furnaces.

Connellsville coke, which recently scored an advance of fully 25 cents, supported by the wage advance of the indepednents to the Frick scale of August 1, shows rather mixed conditions. There is an improvement in demand, but on the other hand the Connellsville region has failed to get some business that would normally come to it, because steel works having idle by-product coking capacity underbid the beehive ovens. Furnace coke is $3.25 to $3.50. Ordinary brands of foundary coke are strong at $4.25, while a few weeks ago they were easily obtainable at $4.00. At least two favorite brands have been marked up in the past week from $4.50 to $4.75, making the market range $4.25 to $4.75, against $4.00 to $4.50 quotable during July and August.

POINTS IN WEEK'S MARKETING NOTES

Business men generally welcome the present market improvement as the beginning of a permanent business revival.

The railways of the U. S. are to get half a billion dallors for the purpose of improving their service. This grant will be followed by others and will no doubt bring businees to other lines.

The Canadian government is being asked by Sydney, N.S., representatives to place orders for steel rails with the mills in that vicinity, so that the rumored shut down owing to lack of orders will not take place.

The volume of sales in pig iron has fallen off during the last week. Present prices however are likely to prevail until the demand increases. Some say that when this occurs there is likely to be an upward revision in prices.

The demand on steel is increasing Business is broadening and practically all classes of buyers are now in the market to some extent. A hopeful tone is very evident throughout the iron and steel trade. The expectation is for a continuous and gradual improvement.

Furnace coke is selling at $3.25 to $3.50, according to Pittsburgh reports, while ordinary brands of foundry coke are strong at $4.25, while a few weeks ago they were easily obtainable at $4.00.

A reduction of 10 in a certain line of milling and grinding machinery has been announced. This took place on September 23rd and is effective from that date.

The demand for machine tools, while not heavy, is steady. Enquiries continue to come in and several ordefs seem to be almost at hand. Dealers in this branch of the market are not complaining.

According to reports a new method of extracting aluminum from a mineral has been discovered in Japan. If present plans go through a refining plant driven by electric power will be established at Yoyogi. A project is under contemplation to establish a semi-governmental company for the manufacture of aluminum by the new method, which consists in the electrical treatment of ore and enables the production of aluminum to be increased.

PRICE REDUCTIONS IN SOME LINES

TORONTO, September 29.—Business generally continues ti improve. Everyone not only feels better but looks better these days. The steel men say that the demand in their market keeps on improving steadily. The change may not amount to much week by week, but in the aggregate it is well worth while For example one dealer told Canadian Machinery that last week he sold 50,000 tons of miscellaneous material on one order alone. This same party said that the month of August showed an improvement of 50 per cent over and above the amount sold in July, and September would in turn prove to be much in advance of August. This of course does not infer that the demand existent is anything like normal. It must be remembered that the steel market took a terrible drop some time ago, and that it will be quite a time yet before normal business can be looked for. It causes considerable optimism, however, when week after week, the figures show an increased demand. Hoops and bars are active, also regular building material, that is the steel used in construction work. The latter of course could well be called seasonable improvement. A point of interest to be noted in this market is the return of the buyer who is purchasing for stock. One dealer mentioned to Canadian Machinery that during the past week two or three shrewd buyers bought a considerable amount of material for stock purposes. When men like the ones described decide to enter the market with confidence, the future is pretty well assured. Although we cannot announce anything definite this week regarding boiler tubes we fully expect that a slight reduction will be in force next week. However we shall secure more details by that time.

Machine Tools

The machine tool dealers have no special complaint to make. Although there is no sensational rush on the part of manufacturers to buy, they at least are showing interest by making enquiries. Several small orders have been closed, and one dealer mentioned that within a few days, or perhaps a little more than a week, he expected to land four orders of good proportions. This would clearly show that the market is not confined to enquiries only.

A peculiar point came up with one of the machine tool dealers when Canadian Machinery asked him how many of the orders received were of the hand to mouth variety. "That's just the trouble," remarked this gentleman. "Everybody seems to hang off until the last moment. For example, one concern ordered from us about $1,500 of small tools. Many of these were special, so that it was impossible to deliver from stock. We explained our position, as they had requested immediate delivery, and imagine our surprise when we found out that they had known, nearly six

months, ago that they would require these goods not later than September. Eventually we got the business, but the delay to them meant real money lost."

A 10% reduction has been made by a Canadian concern on both their milling and grinding machines. This reduction came into effect September 23rd and the reasons given for the change in price are the lower prices paid for material, also a slightly lower wage rate. This reduction applies to all sizes of these two lines. What effect this will have on the demand of these tools remains to be seen, as the change is so recent, that one cannot judge at present.

SEASONAL IMPROVEMENT EXISTS IN SOME LINES—MACHINE TOOLS QUIET

Special to CANADIAN MACHINERY.

MONTREAL, September 29.—From practically all quarters the general improvement in business, noted in the last few weeks, still seems to be evident. There is a certain amount of seasonable stimulation in certain lines, while other lines of business seem to beimproving from the fact that a legitimate demand has been created. Most business men welcome the present improvement as the beginning of a permanent business revival. The future is a closed book to everyone, but one cannot fail to see that our whole realm of business is so interlocked with international affairs that, until, the European disturbances approach something in the nature of a settlement, and near-normal conditions prevail, we in Canada cannot expect our business conditions to be finally adjusted.

Conditions in the United States are so unfailingly reflected here in Canadian business that we cannot afford to ignore them. During the progress of the European war, the United States developed all her manufacturing industries to a point that is far beyond that of her present requirements. The result is that if her plants work to anything like capacity she will have large surpluses of all commodities for export. But her exporting facilities have been badly crippled by an unsuccessful attempt to inaugurate a National Merchant Marine. Her railways have been badly handicapped by financial troubles and during the time that they were operated by the government they were allowed to deteriorate badly. Thus shipping conditions have ruined her chances of an export business. At present she has an abundant supply of manufactured goods with no market in which to dispose of them. Her war transactions have made nearly all the important countries her debtor and to further discourage exporting, a high and really fictitious rate of exchange prevails. Her factories at present are either idle, or working on very short time,

Canada is dependent on the States for a great deal of material, and the interests of the Canadian industries are more or less interlocked with those of the States, and in this way the condition across the line is reflected to some extent in our own country.

But to a certain extent Canada and the United States are in a position to adjust their own peculiar problems of reconstruction, independent of the rest of the World. At the same time we are not by any means independent of world affairs in general. Perhaps in Canada we are not suffering from poor business conditions quite as badly as our neighbors across the border as our basic industry of agriculture shapes our business affairs to a greater extent than it does with our U. S. cousins, and manufacturing, although very important with us, is not quite so great a factor as with them. Prospects of a good crop in the Canadian West this year will put a large sum of money into circulation and will have its effect on reviving business in Canada. In passing through these trying times we see more than ever the importance of developing all our natural resources as far as possible and these in turn will help to develop our manufacturing to a point where we approach the position of being self-sustaining. If such were the condition today we would not be forced to spend so much money under the penalty of an adverse exchange rate.

The railway situation is bad in both countries. It is reported that the U. S. Government has voted half a billion dollars to the railways for the purpose of putting the road beds and rolling stock into first class condition. This grant will be followed by others and will mean a certain amount of business for machine tool dealers and machine shops all over the country. Canada will have to put her railways into first class condition and some such similar expedient will no doubt be resorted to here. This should mean more business for Canadian manufacturers. As soon as the National Railways are fully co-ordinated mediately re-conditioning the roads, and there will be more or less business imediately re-conditioning the roads, and business will no doubt be handled with greater dispatch as the present managements are working at a decided disadvantage. On the whole the Canadian situation is very favorable when compared with that of other countries. Eastern Canada is enjoying a fair trade and the prospects for business during the fall and winter are very encouraging.

The Steel Trade

The government is being approached by representatives of Sydney, N.S., in order to induce it to place orders for rails with the rolling mills in that vicinity, in order that a serious condition of unemployment is not precipatated about the first of November when it is rumored that a general shut-down will occur for lack of orders. There is no doubt but that an order will be given for winter rolling. The government recently placed an order for 40,000 tons of steel rails with the Algoma Steel Corporation for winter rolling, and this order does not represent all their requirements.

The Canadian Car and Foundry Co. are busy on their order for tank cars for the Russian Government. This firm took the order under rather peculiar conditions namely that of having secured payment in advance. This would be an idea for other firms doing business with Russia. Light steel plates continue to be in fairly good demand and sheets are moving comparatively freely yet.

Structural shapes are not in great demand but a few orders are coming along in small lots while bars are very quite. There has been no change whatever in the prices and it is the general consensus of opinion that the present scale of prices represent the low level and as soon as the demand increases the price will strengthen. Present prices really only cover the cost of production with little or no profit.

Pig Iron

Small sales of pig are reported but the volume has fallen off a little in the last ten days. The recent increases in price brought many of the foundries into the market and last month represented the largest monthly business of the present calendar year. Present prices are likely to prevail till the demand appreciably increases, then there will ikely be an upward revision of price. Jobbing foundries are doing a fair amount of business. While some of the larger foundries are operating in a small way.

Trade is very quiet in machine tools. There is practically no demand for new tools. A few sales of re-manufactured tools are reported but the volume is not large. There is a large amount of idle machine tools in the country and it is not likely that new sales will be reported unlike most of the idle machines are put to work. There is a slight tendency to reduce prices but as this action is not expected to stimulate business many manufacturers have made no reductions.

Small Tools and Supplies

The usual amount of business is being done from week to week. Of late, however, some firms which have been out of

the market for some time, have been asking for rates which have in some instances resulted in orders being placed. There is not much of a tendency to adhere to any set price list, and quotations on each order seem to be the method of doing business. The manufacturers are getting their product on the shelves of the jobber and there is a slight indication of getting back to normal, but liquidation in some quarters still continues.

In the last week nothing has occurred to change the same quiet conditions that have prevailed for some time past. Prices are still very weak and no business is offering. Until the foundries get operating again there will probably be but little to report in this connection. No changes in the price of non-ferrous metals have taken place in the last week. The little business offering is of the hand to mouth variety. Perhaps one may discern a slight improvement in the volume of business but it is very slight.

CANADA'S MINERAL PRODUCTION RICH IN COBALT, ASBESTOS AND NICKEL

ALTHOUGH not generally known, Canada produces 90 per cent of the world's cobalt, 88 per cent of its asbestos, and 85 per cent of its nickel. The industry has been somewhat hampered by inaccessibility of location, and lack of necessary capital for exploitation. In spite of these disadvantages considerable improvement has been made, for the value of Canada's mineral production in 1920 was $217,775,080, as against $176,686,390 in the previous year, or an increase of 23.3 per cent. All minerals, with the exception of lead and quartz showed an increase in the value of production over 1919, though in the actual amount produced there were decreases also in pyrites, petroleum and natural gas.

Ontario accounted for the highest mineral revenue with $787,749,178, followed by British Columbia with $38,044,915. Alberta jumped from the previous year to the third place in value, with $33,721,898; Nova Scotia was close behind with $30,187,533, whilst Quebec produced to the extent of $27,722,502. Manitoba's mineral revenue was nearly four millions: New Brunswick's two and a quarter millions; Saskatchewan's over one and a quarter millions, and the Yukon's about the same.

With a production value of more than $81,000,000 copper was Canada's most valuable mineral in 1920. Nickel was next with more than $61,000,000, and zinc third with $40,000,000. Lead was worth $33,000,000; coal $16,000,000 silver $12,000,000; lime $9,000,000; slate $6,500,000; and cement $6,500,000. Ontario accounted for 36.16 per cent of production; Nova Scotia 13.86 per cent; and Quebec 17.73 per cent.

Production in 1920

The combined mineral production value of Canada during 1920 was the highest the Dominion has ever reached, and one attained in conditions of economic depression, falling prices, and a considerable cessation of operations at points which makes the outlook all the more pleasurable for future mineral production. The metallic production which in 1918, when the pinnacle of wartime efforts was attained, was valued at $114,549,152, and fell to $73,262,793 in 1919, came back to $77,236,370 in 1920, whilst the total value of the non-metallic production which in 1918 was $96,752,745, and increased in 1919 to $103,423,507, increased again in 1920 to $140,538,710. About $23,000,000 of this increase is due to coal alone.

There is no question but that production is increasing rapidly, for in 1886 the mineral production of the whole of Canada was only $10,221,255, or $2.23 per capita. In the next five year period, or at the end of 1891, this production value had increased to $18,976,616 and $3.92 per capita. Another substantial increment had been added by 1896, when the production for the year was valued at $22,474,256, and the increase in the next half decade was remarkable, bringing the total for the year 1901 up to $65,797,911.

By 1906 the yearly output was valued at more than $79,000,000; by 1911 at $103,000,000; and in the following five year period the value nearly doubled, accounting for $177,201,534 in 1916. A war-time spurt brought it up to $193,000,000 in 1917, and this movement reached its zenith with $211,000,000 in 1918. In the first war year a depression occurred, but a recovery was made last year that was in itself a record.

BETTER TRAINING FOR MECHANICS

Philadelphia intends holding a conference to discuss methods for restoring the apprentice system of training young men in the various trades. A complaint has been made that this system has been greatly restricted by different labor organizations and that there is laxity in admitting the untrained to employments for which they are not qualified.

The result of this, according to a report in the "New York Herald," has been a deterioration in the quality of output as well as a falling off in the morale of men employed. As a consequence good, trained mechanics are scarce in proportion to industrial needs, and they are all the time growing scarcer. This is bad for the mechanics and bad for the country. High wages and prospective advancement are the rewards of skill. To the attainment of skill there is no royal road. It is acquired only by conscientious instruction.

It is the purpose of those back of the apprentice conference movement to provide ways and means for apprentice training and instruction which shall be thrown open to all, irrespective of any limitations which have been imposed by certain crafts. With more and better mechanics the country's industrial output will be larger and better. On the other hand, ill-directed, circumscribed, haphazard mechanical training of employees, from which our industries have suffered more or less, means a serious national handicap in the sharp world competition ahead.

The matter of improvement in this respect has been taken up by the industrial committee of the Philadelphia Chamber of Commerce. It has interrogated many boards of trade and it has digested a mass of data assembled by experts employed for the purpose. The conclusions reached are that a large proportion of the young men in the various industries merely drift in with wholly inadequate training; that they never acquire skill proportionate to their natural capacities; that, as a consequence, they do not prosper personally as they should and do not produce the wealth the country might expect from them. Some of the experts estimate that 60 per cent of the younger mechanics in this country are thus handicapped.

The responses which have come to the Philadelphia committee have been encouraging. There is distinct promise of valuable results from the proposed conference, and this not merely for Philadelphia but nation wide in inspiring similar efforts in all the great industrial centers.

ELECTRICAL PLANT

A new electric power development will be erected at Great Falls on the Winnipeg river, 63 miles from Winnipeg. It will have a capacity of 168,000 horsepower and will cost about $10,000,000. Announcement of the successful result of financial negotiations was made recently by A. W. McLimont, vice-president of the Winnipeg Electric Railway Company. Work on construction already is under way, with about 200 men employed, but as the work develops between 1,000 and 2,500 men will be engaged.

The undertaking will be carried out under the charter of the Manitoba Power Company, which company is taking over the plant and assets of the Winnipeg River Power Company. Sir Augustus Nanton is president of the Manitoba Power Company, and Mr. McLimont is vice-president in charge of construction and operation. The plant will be constructed in six units of 28,000 horsepower each, and work will be completed in 1924. Promotors of the development believe that the availability of a large quantity of cheap power will do much for Winnipeg's industrial promotion.

The Baldwin Steel Corporation, Ashbridge's Bay, Toronto, have had their business assessment reduced from $483,839 to $264,000, and their building assessment from $800,000 to $325,000.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

Grey forge, Pittsburgh	$22 00
Lake Superior, charcoal, Chicago.	30 00
Standard low phos., Philadelphia.	41 50
Bessemer, Pittsburgh	21 00
Basic, Valley furnace	26 00
Toronto price:—	
Silicon, 2.25% to 2.75%	31 80

IRON AND STEEL

Per 100 lbs. to Large Buyers	Cents
Iron bars, base, Toronto	$ 3 50
Steel bars, base, Toronto	3 50
Iron bars, base, Montreal	3 50
Steel bars, base, Montreal	3 50
Reinforcing bars, base	3 50
Steel hoops	5 00
Tire steel	4 00
Spring steel	6 00
Band steel, No. 10 gauge and 3-16 in. base	4 00
Chequered floor plate 3-16 and heavier	6 00

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

Industrial News

The Liberty Machine Tool Co., Hamilton, Ont., has built to special order, two planers for the Harrisburg Foundry and Machine Co., Harrisburg, Pa.

The B. Greening Wire Co., Hamilton, Ont., has again got back to full time working hours. For some time past the regular schedule was three days a week, but increased orders has made the full time shift possible.

The Canadian Cottons, Ltd., Hamilton, Ont., have once more started on full time schedule. Some time ago the working hours were reduced, but conditions have improved to the point where full time is again possible.

The Parker Motor Car Co., Montreal, capitalized at $10,000,000, has leased space in the works of Caron Bros. at Longue Pointe to provide for assembling cars on a large scale.

It is reported that some 350 men have been taken on again by the International Harvester Co. at Hamilton, Ont. Some time ago it was necessary to let these men out owing to over production, but now conditions have become much better.

The Anglo American Motors Ltd., have obtained a site at Trenton, Ont., on which they intend building a modern plant.

The Sapco Spring Co., Ltd., Toronto, expect to extend their plant, thus increasing their capacity. They make truck springs, and other automobile springs, etc.

The Canadian Gary Motor Truck Co., Toronto, have secured premises on Alantic Ave., and intend installing equipment at once for the manufacture of their trucks, etc.

The City Council of Montreal intend installing new boilers in their pumping station on Craig St. It is expected that these boilers will cost around $15,000. Bids will also be called shortly for four new pumps for the Rielle St. pumping station, and the latter will also cost about $15,000.

Rankin & Co's. planing mill, Toronto Ont., was damaged by fire to the extent of $20,000 on Sept. 24th. The mill, which is a two-storey structure, was gutted, while the excelsior house was slightly damaged. The remaining buildings were untouched.

Notification is made by the Director-General of Commercial Intelligence, Calcutta, that manufactured mica has been exempted by the Government of India from payment of import duty.

The Annual Fall Meeting of the American Welding Society will be held at Philadelphia, during the week commencing October 17. In addition to the technical sessions, provisions are being made for meetings of the American Bureau of Welding, and of its research committees, and of the directors of the society.

According to a statement made by A. H. Morse, managing director of the Marconi Wireless Telegraph Co., of Canada, La Prairie, Que., a little town about six miles from Montreal, will be the site of one of the most complete wireless experimental research stations in the world.

The next British Industries Fair is to be held in London and Birmingham from Feb. 27 to March 10, 1922. This fair is open to manufacturers in every part of the British Empire. It is said to afford an excellent medium for bringing manufacturers in direct contact with buyers, as only bona fide manufacturers are permitted to exhibit and buyers are admitted to these fairs by invitations only. The general public are not admitted. Full details regarding the fairs can be obtained from H. M. Trade Commissioners at 243 St. James Street, Montreal, 260 Confederation Life Building, Toronto, or 610 Electric Railway Chambers, Winnipeg.

The Georgetown Coated Paper Co., has gone back to full time, and it is expected that they will be running at full speed all winter. Another concern in the same town, The Harley Kay Co., is also expected to start on full time immediately. The Manawata Hosiery Co., Palmerston North, New Zealand, has also signed a contract with a Georgetown concern, to have the latter deliver in monthly consignments for a two year period, special automatic knitting machines. This, with other domestic trade will keep the factory spoken of running full time for the next two years.

The English Electric Co. of Canada will have a capitalization of $2,000,000 of 8 per cent preferred stock, and 30,000 shares of no par common. It is understood that control of the company will be vested in the common stock only. Of the 30,000 shares, approximately one-third or 10,000 shares will be handed over to the English Electric Company in payment for the designs, patents, and manufacturing rights which the latter is giving the Canadian concern. Well on to another third of the common stock will be absorbed by preferred shareholders in the form of the bonus of 40 per cent common stock allowed them. Something like 10,000 shares, the remainder of the common stock, will go to the principals who negotiated the deal of whom several are members of the Canadian board of directors of the company. Very little common stock is being allotted to the underwriting firm, the Canadian Debentures Corporation. As holdings of the English company, and of the Canadian principals who were instrumental in bringing the three companies together are about equal the balance of control will be with the remaining Canadian common stockholders, who subscribe to the preferred issue.

The new concern does not need to undertake any important plant extensions or alterations, inasmuch as the existing plant is adapted for a much larger and wider range of production than it is at present being utilized for. It is merely a matter of bringing out designs and patents for new electrical equipment from England, whereupon production of same on a large scale can be undertaken at the St. Catharines factory at once. A portion of the $500,000 order placed by the Toronto tranportation commission with the English company in England will be filled presently by the Canadian company.

Marine News

The new steamship Princess Louise, of the Canadian Pacific Railway Company's British Columbian Coast service, was recently launched at Victoria, B.C. She bears the distinction of being the first marine passenger vessel constructed in British Columbia. Her timbers, except for the hardwoods, were grown in this province, and her boilers and other mechanical fittings were made in British Columbia. The efforts of the builders were to make the Princess Louise an "all British Columbian" product. She is 330 feet over all, and can attain a speed of 17½ knots loaded.

As an illustration of what can be done in the port of Montreal in the quick despatching of ships, the steamer Manchester Civilian, of the Manchester Line, which arrived here light at 10.30 a.m. Monday, was scheduled to sail Wednes-

day for Rotterdam with 264.000 bushels of wheat. The steamer was passed by the port warden an hour after her arrival and commenced to load her cargo at one o'clock.

The second of the 10.500 ton ships built for the Canadian Government Merchant Marine by the Halifax shipyards, the Canadian Constructor, has been launched at Halifax. The first of these ships, the Canadian Cruiser, which was launched some weeks ago, will come into commission about the end of this month, according to a statement by Mr. R. R. Teakle, general manager of the C.G.M.M.

Following extensive investigation of tides in Baie de Chaleur and in the various harbors along the Atlantic coast, the Naval Department is issuing tide tables for the guidance of mariners for the year 1922. This work is being carried on under the supervision of Dr. W. Bell Dawson, superintendent of tidal surveys. During the summer observations of tidal actions were made at Campbelltown and Dalhousie, on Baie de Chaleur; at Gaspe, Fox River, at Seven Islands, on the St. Lawrence, and at St. John, Halifax and other ports.

Incorporations

The Wahl Co., manufacturers of eversharp pencils, fountain pens, etc., have incorporated as a Canadian company, and will manufacture their line in Toronto, having leased part of the Cowan factory building on Sterling Rd.

The Watkins Mfg. Co., Ltd., Kingston, Ont., has been incorporated with a capital stock of $15,000 by James McK. Hughes, William McA. Nickle and others to manufacture machinery, metals and to rebabbitt automobiles, marine, traction and other mechanical parts, etc.

The Duro Aluminum Ltd., has been incorporated at Hamilton, Ont., to manufacture aluminum ware, enamel ware tinware, sheet metal ware etc. The authorized capital will be $200,000, the gentlemen interested being John A. Soule, Philip M. Cross and James M. Dunn.

The North Shipping Co., and the South Shipping Co., have been incorporated under the Dominion Companies Act. The offices will be at Quebec, and the authorized capital of each company is $500,000. It is the intention of these companies to transport passengers, mail and merchandise, and do towing and wrecking, etc., in any navigable waters in and bordering on the Dominion, and to and from any foreign port. The incorporators are as follows:— A. C., and H. P., Hill. C. H. Maclaren, S. A. V. Martin and L. Mattman, Ottawa. It is said that these companies are subsidiaries of the Clark Steamsnip Co., which operates steamships on the north and south shores of the St Lawrence river.

The Taylor O. K. Mfg. Co., Ltd., Hull, Que., have recently been incorporated with a capital stock of $200,000. This concern intends manufacturing storage batteries, but at present they do not plan to erect a plant although it is thought this may be necessary next year. Officers are: President, H. A. Champaigne; secretary-treasurer, J. W. Ste. Marie and general manager, Ray Murray. Offices of the Company are at 11 Youville street, Hull, Que.

DROP IN PRICES ON FARM MACHINERY

Reductions Ranging from 15 to 30 per Cent Are Announced by Big Implement Firms in Canada— Farmers Will Benefit

The Massey Harris Co., with headquarters in Toronto, and the Cockshutt Plow Company, of Brantford, have announced reductions in prices from 15 to 30 per cent. Mr. Thomas Bradshaw, treasurer of the former company, says that the average reduction would be about 20 per cent. This applies to all finished implements stored at the headquarters here or in the different branches and is based upon an estimate of the lowered cost of production, applicable to implements hereafter to be turned out, although the implements now being offered for sale were produced under higher cost conditions.

Mr. Wedlake, general manager of the Cockshutt Plow Co., says that big cuts in inventory have made the new price possible. It means a cut on the other side of profits, according to Mr. Wedlake, and this cut will be about 25 per cent. It is expected that normal operations in this plant will gradually be arrived at.

Mr. S. B. Chadsey, general manager of the Massey-Harris plant here, says that as there are many varied lines manufactured, the cuts would run from 20 per cent. to 25 per cent. It is stated that the manufacturers in general base their new prices upon a drop in cost of material and labor of approximately 20 per cent. In some cases these cuts in wages have been made, in others, there had been no change up to the time of the closing of the factories. Mr. Chadsey said that it was not correct to say that a cut of 20 per cent. would be made in wages, but that there would be a readjustment of wages, which would approximate an average reduction of 20 per cent.

EQUIPMENT WANTED

A firm in the west desires to purchase several items of equipment including the following:—A six foot shear; a small punch press; a key seating machine, a six foot power brake; a power drill; a 14 inch lathe; a set of four foot rolls; an 8 or 10 h. p. motor. Those interested should write the Link Mfg. Co., Portage La Prairie, Manitoba.

DRAWBACK ALLOWED ON IMPORTED SHEETS

Imported Steel Sheets, When Used In The Manufacture of Stampings For Automobiles, Are Allowed Drawback

Anyone using imported sheets in the manufacture of stampings for automobiles will be interested in the following regulations which are now in force. under the provisions of sections 286 of the Customs Act:—

When imported steel sheets, hot or cold rolled, or coated with lead or a combination of lead and tin, number sixteen gauge and thinner but not thinner than number twenty-four gauge, measuring from twenty to forty-two inches in width and from fifty to one hundred and twenty inches in length, on which Customs duties have been paid, are used, after the thirty-first day of July, nineteen hundred and twenty-one and until otherwise ordered, in the manufacture of stamping for automobiles, there may be paid a drawback of ninety-nine per centum of the Customs duties paid on the steel sheets so used. Provided, however, the said drawback shall not be paid unless the duty has been paid on the steel sheets so used as aforesaid within twelve months of the manufacture of the said stampings for automobiles, subject to the following conditions, viz:—

(a) The quantity of steel sheets used and the amount of Customs duties paid thereon shall be ascertained;

(b) Satisfactory evidence shall be furnished in respect to the manufacture in Canada of the stampings for automobiles.

The claim for drawback shall be verified under oath before a Collector of Customs to the satisfaction of the Minister of Customs and Excise, in such form as he shall prescribe, within one year after the manufacture of the stampings for automobiles. The Minister may also require in any case the production of such further evidence, in addition to the usual averments, as he deems necessary to establish the bona fides of the claim. All claims for drawback under the foregoing regulations should be made on Form K. 15½.

Obituary

A. B. Petrie of Guelph, president and founder of the Petrie Mfg. Co., Hamilton, Ont., died at his home a few days ago. Mr. Petrie, who had reached the age of 80, started the Petrie Mfg. Co. some 20 years ago, the first factory being in Galt. The business was next moved to Guelph, then later brought to Hamilton about 16 years ago. This firm which manufactures cream separators, gasoline engines, and sprayers, will be carried on by the five sons, A. B. Jr. H. J.; P. S.; C. M. and G. R. Petrie, all of whom are interested in the business.

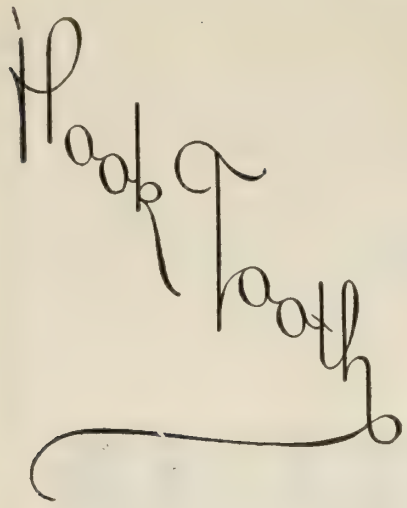
Right in the Lead

THREE PER MINUTE

OF THESE DROP-FORGED STEERING ARMS
⅞ in.—14 U.S.F., ¾ in. LONG
Threaded on a Geometric Threading Machine at a Prominent U.S. Auto Factory

Another Geometric Threading Machine was given the work of threading both ends of steel brake pull rods. Production jumped to 70 rods per hour (threaded both ends) where only 30 rods an hour had been previously threaded. The Geometric Threading Machine increased production and cut costs on the work, beside releasing the big turret lathes for other work more in their line.

The biggest recent record with a Geometric Threading Machine was in threading 4,000 Graphophone Brass Mouth Pieces in one day. Before the work was put on a Geometric Threading Machine a solid die was used, and, with the necessary backing off, only 800 pieces could be threaded in one day.



The Geometric Threading Machines produce work in quantities—rapidly, accurately, profitably—with a minimum of attention. There are three sizes—1-2 inch, 3-4 inch and 1 1-2 inch.

There are three styles—Single Spindle, Double Spindle, and Bench Threading Machine.

SEMI-ARID STATES WILL BE RECLAIMED

Plans are being made for the reclamation of the semi-arid states of Brazil. A large amount of engineering and construction work is going to be accomplished, and this work, which is located in the states of Ceara and Parahyba, will include the construction of five large dams involving nearly a million cubic yards of concrete—to create storage reservoirs, some of which are to be larger than any artificial reservoirs existing elsewhere. The work is to be conducted under the direction of the Brazilian Government, and in its ultimate importance and economic value it is comparable to the irrigation work carried on since 1903 by the United States government.

In these semi-arid states of Brazil there is an average rainfall of about 30 inches, which if properly distributed as to time and volume would make, even under the tropical sun, a sufficient supply of moisture to produce moderate crops. The climate, however, consists of a dry season extending from May to December and a rainy season lasting from January to April or thereabouts. Practically all of the rainfall occurs during the rainy season months when, if the precipitation falls in heavy rains, the soil is saturated, the springs are renewed and the rivers are in flood. In the dry years, however, the rainfall, although aggregating as much as the average year, may be precipitated largely in thin showers which, under a tropical sun, are quickly evaporated, with the result that the soil does no become well moistened and the rivers carry little if any run-off. Severe droughts result which reduce the inhabitants of this section to a condition of starvation. It is to remedy this situation that this reclamation programme has been undertaken.

The region to be benefited, lying in Latitude 4 to 8 degrees south of the Equator, will have climatic possibilities similar to southern Arizona and California or the irrigated section of the west coast of Mexico. The streams which drain the region are of large volume and will furnish ample supply for reservoirs. The products of the country include cotton, sugar, skins, medicinal products, various kinds of palm and other nuts for the production of vegetable oils, citrous fruits and other products of tropical and sub-tropical agriculture. The people of the region are known as among the most energetic in Brazil and are valued all over the republic for their industry and effectiveness as workers. The work is under the direct control of the Inspectoria de Obras Contra as Seccas which is a department of the Ministry of Viacao e Obras Publicas. The Inspector General in charge of the work is Dr. Miguel Arrojado Lisboa. Dr. Pires do Rio is the Minister of Viacao e Obras Publicas. The initiation of active work at the present time is due in large measure to the interest shown by the president, Dr. Epitacio Pessoa, who has given this programme for the material betterment of a needy section of his country.

Dwight P. Robinson & Co., Inc., New York, are going to supervise a large amount of this engineering work.

Motor Transport

Motor lorry transport has developed considerably in Switzerland during the last two years, according to the former commercial secretary to H. M. Legation at Berne. This condition exists largely because a great inflow of army trucks was obtained at relatively low cost from the various belligerent countries—and the railway concerns are becoming adversely affected to a marked extent by their competition. Motor lorry transport has also been encouraged by the increase in railway rates, and seems destined to develop still greater powers of competition in the near future for internal goods traffic. Owing to the comparatively small area of Switzerland the distances to be traversed may well not warrant the expenditure entailed by cartage to the station of despatch and from the station of destination, with its attendant waste of time and labor in double registration, waiting for receipts, delivery of goods and double breaking of bulk, and the simpler and more economic method would appear to be the use of lorries from door to door for short distances.

GERMAN STEEL TRADE HAVING BOOM

Steel Trade Has Boom—Factories Booked Up to End of October—Further Orders in Sight

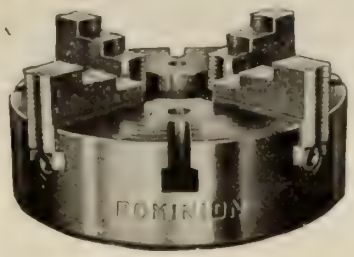
The German iron and steel industries are at present experiencing a boom. The various factories are booked up to the end of October, and according to reports, England, Holland and South American countries are the largest buyers.

The rush to place orders is explained in part by the low value of the mark. However, it is believed prices will advance later on. They are now lower than those quoted at the time of the industrial stagnation last spring. Higher wage scales have been agreed to between employers and labor, employers acting on the theory that this will enable them to avoid a period of strikes which would hamper many industries.

The demand for coal and pig iron is heavy and is sending prices soaring. This, it is believed, will continue until French imports again stabilize the markets. The demand for half manufactured steel for immediate delivery is greater than the mills can meet. Rails, railroad material, and, lately, locomotives and cars are much sought for. The machine works have orders, but are complaining of difficulties in meeting the higher cost of raw materials.

Engineering News

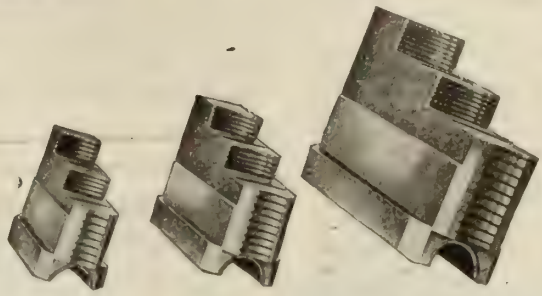
The General Motors of Canada intend going after export business in motor cars in deadly earnest. Col. R. S. McLaughlin, president of the company, says that he is confident that operations will be steady in the Oshawa plants during the coming winter. He states that much depends on export business, which is now opening up. The company now has initial specifications of 1,000 cars of all makes which are to be taken in the next few months, and as business conditions right themselves in various parts of the world this trade should assume a considerable volume. The receipt of these offers would have a steadying effect, especially at this time of the year.



The first shipment of Canadian goods to Russia since the Bolshevik revolution will be made from Montreal in October, when the advance consignment of five hundred oil tank cars, now nearing completion in the shops of the Canada Car and Foundry Company, will be placed aboard vessels of the Canadian Government Merchant Marine for transportation to Novorossusk, a Russian port on the Black Sea. Four of the largest Government freighters will be used to carry the cars to Russia, and it is expected the final shipment will be made from Montreal before the close of navigation.

There is some talk of an assembling plant being erected in Walkerville by the Reo Motor Car Co. Although nothing official has been reported, the rumor has it that the Reo Co., hopes to begin assembling its cars in Walkerville by the beginning of next year. The Dodge Bros. Co., have also been negotiating for a site, if the talk on the streets is correct.

BETTER LUCK NEXT TIME



Following are the names of those who submitted correct lists for the Sept. 8th contest:—W. J. Lawrence, Montreal; E. Ergott, Toronto; George Land, Peterboro; Paul W. Lohner, Lockport, N.S.; Stanley F. Lennox, Belleville; T. Parker Lachine, Que.; A. M. Jagger, Hamilton; F. Webb, Dundas; L. T. Churchill, Calgary, Alta.; Burton H. Galbraith, St. John N. B.; John H. Wood, Toronto; G. F. Sanders, Cargill, Ont.; F. Drackley, Sault Ste. Marie; John McCampbell, Tessalon, Ont.; H. N. Bethune, Hamilton, Ont.; and Paul A. Wink, Cobalt, Ont.

The Selson Engineering Co., New York, and Coventry, England, have an interesting catalogue describing their machine tools, attachments, etc. Lathes of all kinds and sizes are shown, also shaping machines both hand and power. Radial drilling machines; mitreing and slotting machines; tool grinding machines, metal saws, tooth rounders, and many other lines are included in the 48 pages of this book.

Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

Address it to

The Editor, Canadian Machinery

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Why Heat Your Factory Only in Spots?

The Skinner Bros. (Baetz Patent) Heating System will heat all of the open space in your factory all of the time—there will be no places continually too warm while others are too cold, as is usually the case with old-time heating systems.

Simple and Economical

Skinner Bros. (Baetz Patent) Heaters operate without outside pipes or ducts. They are portable and require no foundations—cost of installation is 15% to 50% less than any other system—operating cost is equally low. The mild, constant circulation of warm air does not cause drafts or air blasts, raise floor dust or create other conditions injurious to the health of employees.

Mechanical Details

Built as an individual enclosed unit with a series of pipe coils compactly mounted above a powerful fan-wheel. Coils are heated by exhaust or live steam. Cold air is drawn into the heater by the fan, impelled upward and around the coils, and, after being heated, is diffused through outlet hoods to every part of the open area. No pipes or ducts used. The fan is operated by any power available.

Direct-Fired Type

Where steam is not available, we supply our direct-fired type DF, which burns coal, coke or wood. Built on the same scientific principle as type SC. The fan is operated by any power available.

Get Further Details

The principle of operation of Skinner Bros. (Baetz Patent) Heaters is briefly described at the left. Performance is guaranteed on a strictly money-refund basis. Complete detailed information and list of users will be sent on request. Please use the coupon.

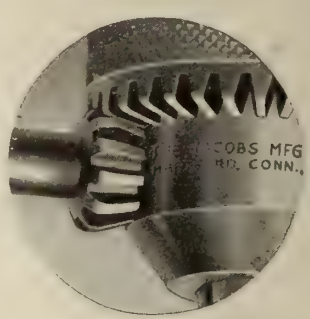
Jacobs Super Chuck

Patented 1909-1915. Other patents pending

A Look Inside

Here are the several parts—carefully designed, exactly fitted, perfectly made—that guarantee the Jacobs Super Chuck to hold a drill tight, to hold it right, and to keep on doing its work indefinitely.



FIRST THE BODY—scientifically casehardened; size limits within .0005″, arbor hole ground on a special fixture with six gages to position it accurately in relation to the hole for the jaw.

THE SLOT FOR THE NUT, correctly located in relation to the jaw holes by means of micrometer gages, insures a properly fitting thread on the nut and jaws.

NO WEAR ON KEY HOLES because of the deeply casehardened body, result—a well fitting Gear on Sleeve and Key.

THE JAW, OF TOOL STEEL, has glass hard gripping surface; threads are tough, and all surfaces are ground on centers to within **a quarter of a thousandth** of an inch.

THE NUT, of special analysis steel, is ground after heat-treatment, in correct alignment with thread; tolerance .0005″.

THE BALL RACE comes within limits of .0001″; finest grade balls are used. An important point is the pitch of thread on nut—angle is 90 degrees to center line of jaw, so part cannot run over thread of latter.

The Jacobs Super Chuck centers a drill, **accurately,** and will continue to do so after years of use. It saves its cost time and again by preventing drill breakage. Its correct balance preserves bearings of your drilling machine—order a Super Chuck from your dealer.

The product of over half a century's experience

BRITISH SMELTING & REFINING Co LTD

DRUMMOND BUILDING MONTREAL and 13 VICTORIA STREET LONDON S.W.1

You Need a Good Die Stock Set

If you need one at all.

Because a **GOOD** Die Stock Set embodies:

1. Accuracy in its product.
2. Adjustment for wear.
3. Free cutting qualities.
4. Provision for sharpening.
5. Ample adjustment for oversize or undersize.

P. & W. Die Stock Dies **ARE GOOD DIES.**

BETTER than most because of the interchangeable feature in their chasers. A brcken chaser in a P. & W. Die doesn't mean a new set of chasers. You can get a new chaser to replace a breakage and the new one "fits in" perfectly in your old set. That's the 6th point, **"ECONOMY IN OPERATION."**

The New Canadian-Detroit Double-D Rolled Drill

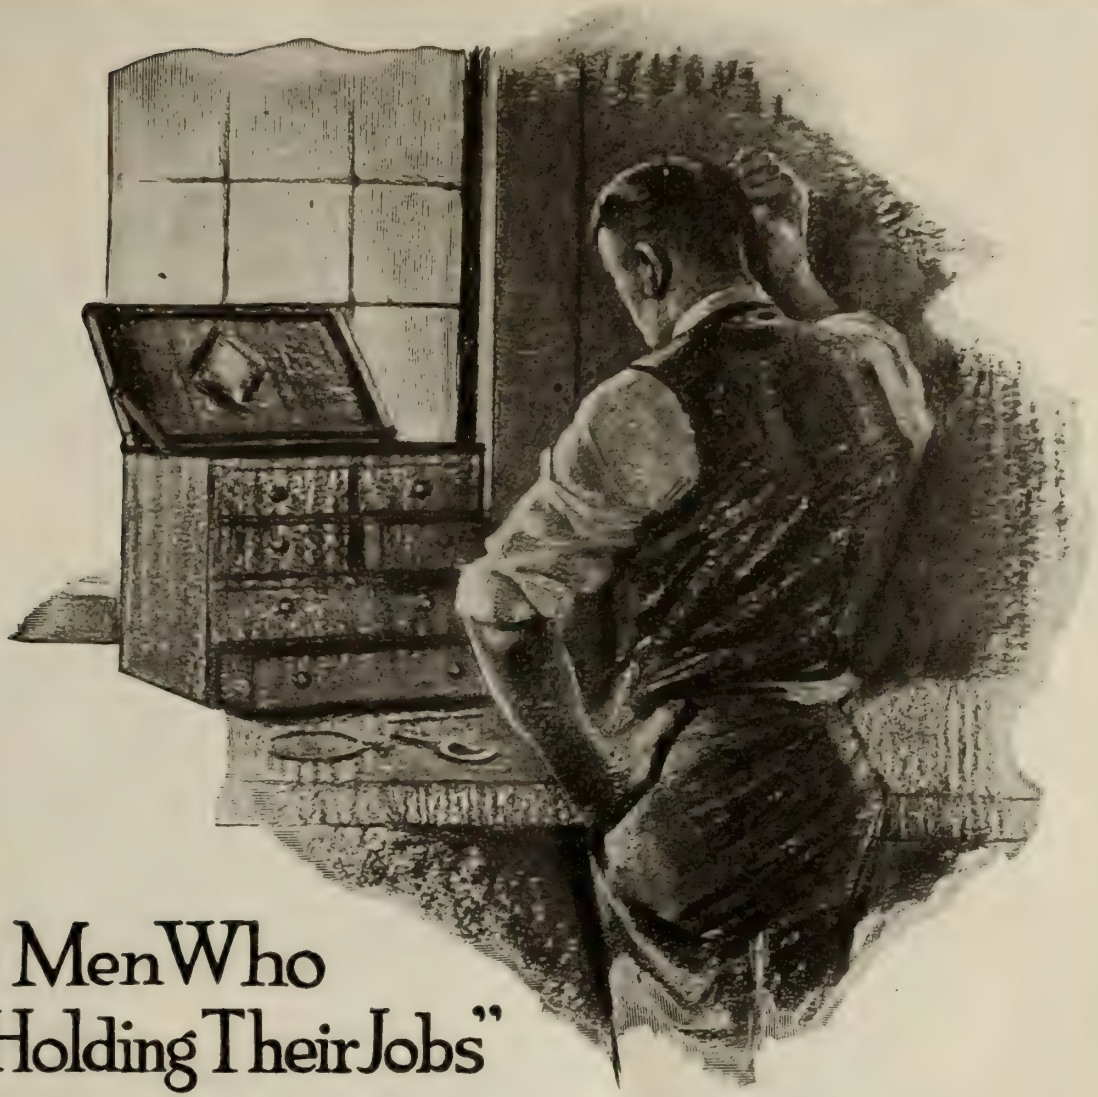
Made in Canada

PRODUCTION requirements in an ever-increasing number of plants necessitate the use of a strong, accurate drill, specially designed for hard drop forgings, steel castings, and other alloy steels equally tough and difficult to drill.

For this service we have developed a hot rolled process drill known as the Canadian-Detroit Double-D (DD) Rolled Drill. It combines the strength of the forged type drill with the accuracy and uniformity of the milled type.

The flute of the DD is formed straight from the bar stock by successive passes through specially built and patented rolls at a temperature of 1850° F. This mechanical rolling of the flutes produces a refinement and uniformity in the grain of the steel and gives additional density at the centre and at the outer edge. Each drill is rolled separately, and the rolls are so designed and operated as to produce the same uniform increase in web thickness as is obtained in high-grade drill of the milled type.

The fluted drill is reheated and twisted in a specially designed automatic machine. The twisting process is held absolutely uniform, giving the same increase in helix angle from shank to point, 27° to 32°: this standard has been adopted on our milled drills and has been proven by exhaustive experiments to be the most efficient.



The DD has increased production and cut drilling costs in many of the finest plants in Canada. A fair test will convince you.

Manufactured and carried in stock at Walkerville in all sizes from ½ inch to 1½ inches.

We also manufacture and carry in stock all sizes and types of high speed and carbon milled drills.

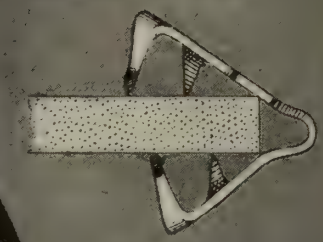
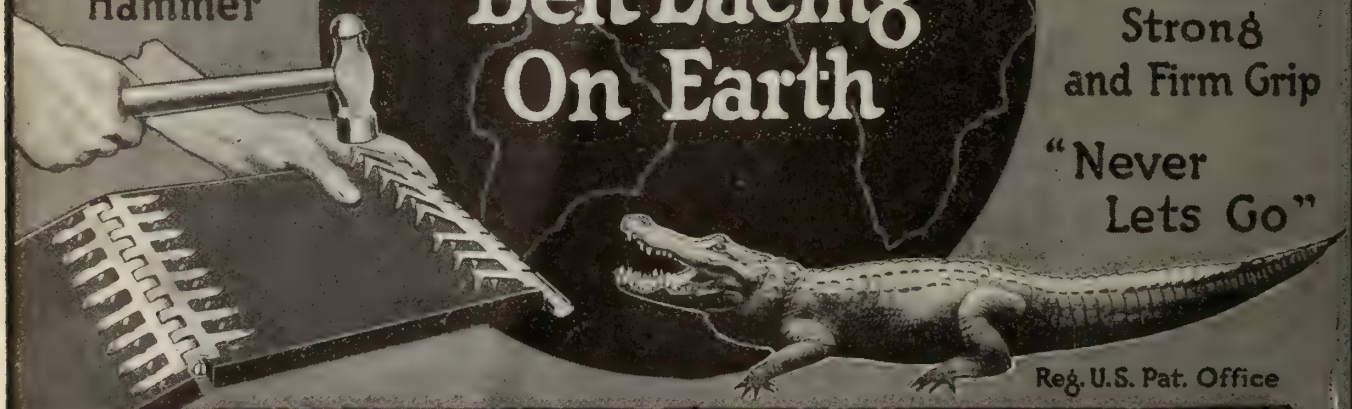
ALLIGATOR



TRADE MARK REG. U.S. PAT. OFFICE

STEEL BELT LACING

Best for Every Type of Belting



Nothing Needed But a Hammer

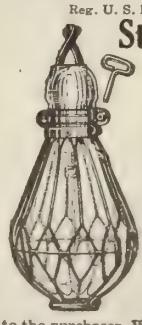
The Strongest Belt Lacing On Earth

Double Staggered Teeth Insures Strong and Firm Grip

"Never Lets Go"

Reg. U.S. Pat. Office

Jobbers—Dealers



Sell Satisfaction and Economy When They Sell ALLIGATOR Steel Belt Lacing

Go over these features that make "ALLIGATOR" the best belt lacing proposition for you and for your trade.

FLEXCO-LOK

Reg. U. S. Pat. Office

Steel Lamp Guards

Protects lamps from breakage and theft—property from fire. An efficient, inexpensive security against danger, losses and delays.

Made in all styles and sizes with reflectors and handles if desired. Patent lock prevents theft. Sold at a distinct economy to the purchaser. Write on letterhead for information, prices, etc. Not in stock in London.

First: National and local advertising in carefully selected general publications, trade papers and consumer class publications interests all belt users and creates a demand that has been growing for twelve years.

Second: ALLIGATOR is preferred by Master Mechanics in every industry all over the world for its ease and facility of application, long life in operation, belt saving characteristics and economical features. The decision of hundreds of thousands of belting users should influence you to stock it.

Here are other reasons:

ALLIGATOR is the most easily and quickly applied of all belt lacings. **Only a hammer needed and three minutes average time** to lace a belt. Anyone can put it on.

Besides this important feature, this belt lacing has proven the strongest and consequently the **most efficient** in every test.

It outlasts any other type of belt lacing—and **saves the belting.** See illustration and note how the staggered teeth penetrate without injuring the belt and clinch down flat. Also note the sectional steel rocker hinge pin which makes a flexible hinge joint that hugs the pulley, is no thicker than the belt, and permits belt to be run on both surfaces.

In addition the use of ALLIGATOR Steel Belt Lacing is the most economical manner of taking up stretch on new belts and of relacing and repairing old ones. Only one end of belt need be cut off in shortening; or to lengthen, insert stub of correct length.

Can be kept handy in stockroom or tool box for immediate service thus avoiding any possible delays. Represents big saving and convenience to your customers on any kind of belting. A complete service for all thicknesses of power or conveyor belting. A size and type for every need. Write on letter head for samples and trade prices.

COLUMBIA

THE BRUSH IT NEEDS!

WHICH is the most suitable brush for any machine depends on correct analysis of all the relevant facts. That is why the Columbia Data Sheet Service improves motor and generator efficiencies. The essential facts are ascertained by Columbia Brush Specialists. These facts are carefully analyzed by the Columbia Board of Engineers. The Columbia Pyramid Brushes specified as correct for each unit are guaranteed to give satisfactory service.

Columbia Data Sheet Service is at your command. It does not matter whether you have one brush equipped unit or a thousand. Avail yourself of it.

LA SALLE

Has an Advantage Over Other Grinders

There is some outstanding feature of all La Salle Grinding Machines that lends it exceptional productive ability.
The American Drill Grinder is especially adaptable for grinding twist, flat and three-lipped drills, because it has automatic lip rest and caliper jaw device, which assures proper clearance on all sizes of drills automatically. Send for descriptive matter covering our entire line of grinding machinery.

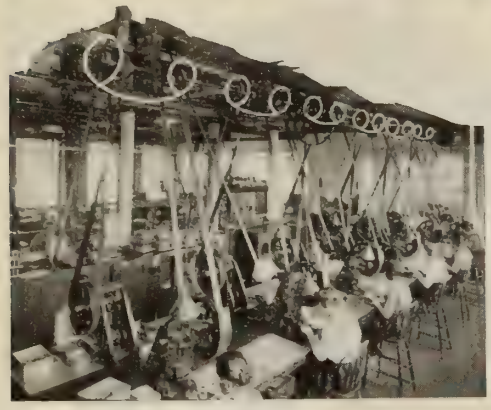
The B & D Switch Handle Cases illustrated are Franklin Die Cast in Aluminum.

Greater Comfort for Motorists

STEP into a car to-day — press a button—off you go! No cranking, no fuss. The development of automobile accessories has been largely responsible for making the ownership of a motor car more and more trouble-free.

In their search for speedy and economical production methods, automobile accessory manufacturers soon avail themselves extensively of the die-casting process. Franklin Die-Cast parts are used in magnetos, truck governors, engine-driven tire pumps, lighting systems, electric drills and valve grinders, measuring pumps for gasoline and other accessories.



In 1892 we originated the Die-Casting Process. For nearly thirty years we have been reducing the cost and simplifying the output in many fields of industry. The addition of a special process for the production of finished brass castings now enables us to offer parts in brass, bronze, aluminum, tin, lead or zinc base alloys as conditions require, thus meeting a still wider range of work.

We quote from samples or blueprints. Write for booklet, "Franklin Die-Castings in Many Fields."

FRANKLIN DIE-CASTING CORPORATION

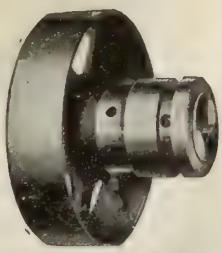
FRANKLIN DIE-CASTINGS

THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

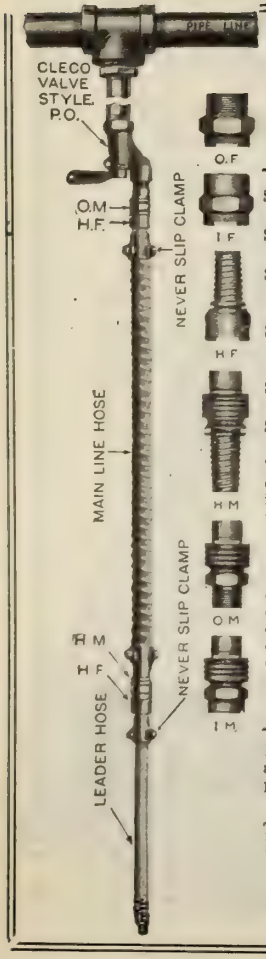
COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.



You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building." and our Yellow Catalog.

Cleco Pressure-Seated Air Valves

Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps and Cleco Grooved Hose Nipples and Hose Clamp Tool

STYLE O.F. is an Outside Thread Female Pipe End. made in sizes ⅜-inch to 1½-inch.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼ inch to 1½-inch.

STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ⅜-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.

CLECO AIR VALVES.

Style R.A. **Style P.O.** **Style A.**

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style R.A.—Right Angle Valve, made in sizes ¼ in., ⅜ in., ½ in., and ¾ in.

CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

The Lightening Hose Clamp Tool illustrated applies wire clamps at a cost of 1½ cents each.

In stock: Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

Use Annealed Wire No. 14

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.

Bulletins Nos. 46, 48 and 51. mailed on request.

THE MODEL HOSE LINE illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

HESPELER, ONTARIO

The latest pipe machine hand book. 60 pages of valuable information. Close to 75 drawings and photographs. Send in the coupon today.

Questions and Answers to Pipe Machine Troubles

A valuable hand-book free for the asking-----

You'll find the answer to your pipe machine problem in the new Williams hand-book "Don't Let It Happen To You!" Whether it is how to grind dies, what kind of oil to use, or how to eliminate wavy, chattering threads, you'll find the practical answer in the new Williams 60 page hand-book entitled "Don't Let It Happen To You!"

The first chapter is an interesting illustrated short story that carries a smile and a moral for every pipe user. You will enjoy reading it.

A following section takes up the proper lip, clearance lead, chip space, etc., under the chapter heading "The Principles of Correct Pipe Threading."

Other chapters are devoted to "Care and Repair of Dies," "How to Properly Grind Dies," and perhaps most important, from the standpoint of practical value, "Pipe Machine Troubles—Their Causes and Remedies."

There are close to 75 drawings and photographs and the articles have been written by men of practical and long-time experience in the use of pipe machinery.

Clip the coupon. Mail it now for this book which is as valuable to a pipe machine user as a slide rule to an engineer.

Quality or Economy— Which is of Greatest Importance to YOU?

PRETTY hard to say; isn't it? In the final analysis quality and economy are mighty close to twin brothers, and both must be measured in terms of service.

How well the case-hardened part performs its function, on an average, depends on how the various elements in the carbonizing process "average up." Keeping down spoilage and maintaining a fairly accurate uniformity of case, heat after heat, calls for containers that not only give long service but behave in a uniform way throughout their entire usefulness.

From every angle that affects either quality or economy, Cast Nichrome Containers average up to the highest satisfaction point. The proof exists in hundreds of modern plants.

Canadian Hart Wheels

Vitrified—Silicate Shellac

Three classes of abrasive wheels that embody all the essentials for a wide variety of operations. While Vitrified Wheels will meet most requirements, the others are characteristically suited for certain classes of work.

THE big reason for grinding wheel dissatisfaction lies in the improper choice of the abrasive with relation to the work in hand.

Just as there are different jobs so are there different abrasives.

For over 34 years we have been improving on our processes. You can, therefore, leave the choosing to us and get satisfaction.

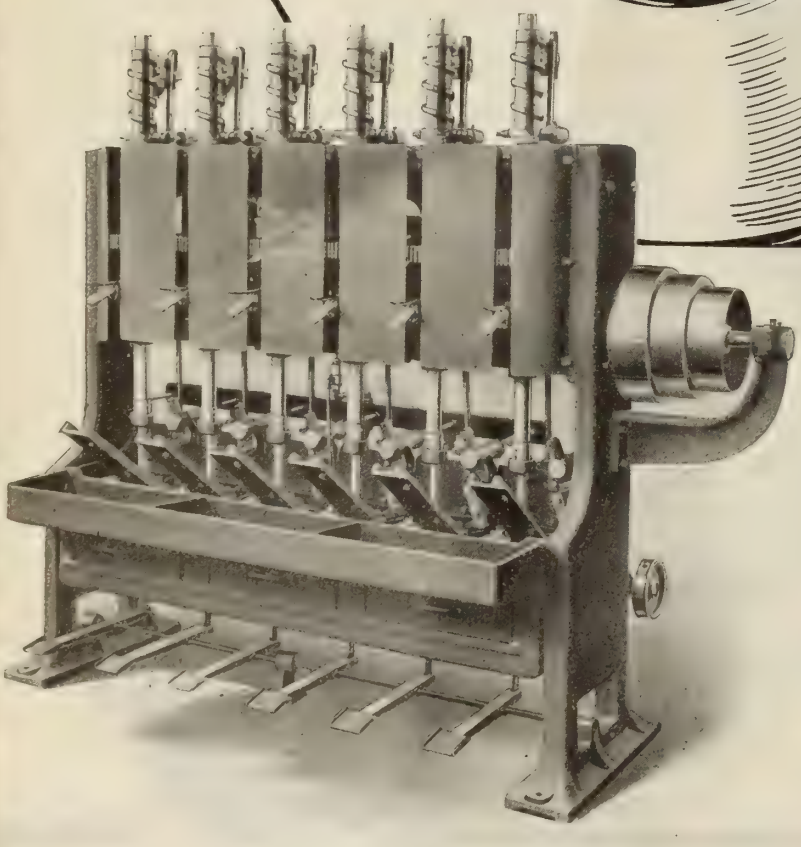
Vitrified—Silicate and Shellac are the wheels that give long service.

Made in Canada

Vitrified Wheels—may be used wet or dry; give better all-round satisfaction and have a longer life.

Silicate Wheels—can be made in twenty-four hours and are sometimes substituted for Vitrified Wheels where speed is essential.

Shellac or Elastic Wheels—indispensable for slotting work where a thin wheel is required or where special finish is desired.



These wheels are fully described in our new catalogue. A copy should be in your files. Well?

Canadian Hart Products Limited

ACME
NUT TAPPING MACHINES

Bigger Output in Tapping!

SPEED—the all-essential of bigger outputs—is the chief feature of Acme Nut Tappers. With these easily operated tools it is possible to obtain speed which is limited only by the endurance of the taps.

But speed alone is useless. It must be coupled with accuracy and the ability to stand gruelling service for long periods of time. This too is found in Acme Tappers.

The Acme Six Spindle Semi-Automatic Nut Tapper shown here has many important features which facilitate rapid production. Each spindle is equipped with automatic lifting device which permits automatic feed to place nut under tap. Every action has been carefully developed and proved correct in practice.

Our catalogue gives complete details of Acme Bolt, Nut, Rivet, Upsetting and Forging Machinery. Write for a copy.

Landis Chasers Don't Roll the Stock---They CUT

The "close-up" shown in the circle explains how the chasers of a Landis Die are set against the work at a tangent. Incidentally it shows why Landis Pipe and Nipple Threading Machines are considered standard equipment by leading manufacturers of nipples. The Western Plumbing and Supply Co., of Chicago, where these photographs were taken, have five Landis Machines in the shop. The two-inch nipples shown are threaded for over two inches on each end. Threads are of good quality—production 200 pieces per hour.

This user says:—
"From results received we have decided to use the Landis on our work exclusively."

The chasers do not gouge, rip or push out the metal--they **cut** with a shearing stroke, which produces threads with the least exertion and least wear on chasers. Over 10,000 threads without regrinding is the usual thing in work like that above. Chasers cost you less than any others for all annealing, hobbing and retempering are unnecessary.

Let us tell you more about the economy and reliability of Landis equipment. Write to-day.

Why should I buy GTD Taps and Dies?

AS you turn the pages of the magazines and note the many advertising announcements—you must often have asked this question:

"Are all taps and dies alike?"

If they are, then your decision is influenced mainly by the attitude of the people who make them—their friendliness, their understanding of your needs, and their aggressiveness in urging you to buy their product instead of some other.

If taps and dies are *not* alike, how do they differ?

Take the matter of metal buying—or heat treatment, or uniformity in production. Some products excel over others in each case. Or consider accuracy, rapidly becoming a first consideration in buying taps and dies. Or such elements as adaptibility or application!

Consider GTD with these fundamental differences in mind. Think of the tap and die specialties now so universally used which are ours and were first made by us:

The Button Die
The Round Adjustable Split Die
The *"Little Giant"* Die
The *"Acorn"* Die
The *"Gun"* Tap
The *"Maxi-Staybolt"* Tap, etc.,

In all of these tools there are *differences* which distinguish them from taps and dies so often thought of as "all alike."

Back of these differences is the pioneer work in screw-cutting tool manufacture, of Wiley & Russell, Reese, Wells Brothers—names that have stood and still stand for the painstaking effort that only real genius gives to its task.

No, taps and dies are not all alike. There are differences that most observers can detect. And these differences which make it worth any tool-user's while to look for the GTD trademark and *insist on it*—are the things on which our advertising and our salesmanship put the emphasis.

Screw Thread Text Books Free

Our catalogs and descriptive booklets on GTD threading tools are really text books on the subjects they cover and as such are valuable to any shop worker or executive. Let us mail them to you without cost. Use the coupon and indicate whether you are using production or repair tools or both.

A Complete Treatise---Fully Illustrated On Cylinder Regrinding as a Business

This booklet, which is fully illustrated, completely covers the possibilities and profits that can be derived by those in a position to do cylinder regrinding.

It states specific cases of the profits earned and gives data which will enable you to figure just how much you can make in your own locality.

It tells who are best adapted to do this work and why. It also explains where to get work and advises how to make inquiries as to your chances. Gives letters and examples of what other regrinding concerns have done.

Perhaps you would like to know what equipment is required and where to get it. Are you fully acquainted with the component parts necessary for such a shop? All this is covered completely so you will know just how much you should have to handle regrinding properly.

Are you fully convinced of the advantages and know the reasons why a motor should be reground? Can you tell why regrinding will stop the engine from skipping and knocking, reduces the formation of carbon, increases compression, and gives many more miles on fewer gallons of gas and oil? All this is fully explained as well as the advantages of regrinding over reboring, reaming or lapping, why reground cylinders are better than new ones, also when to regrind. It has been carefully compiled and checked. It is not a catalog, volume of specifications, or a selling piece, but a real book covering the field and profits, equipment required, and the reasons why. The edition is limited. Where shall we send yours?

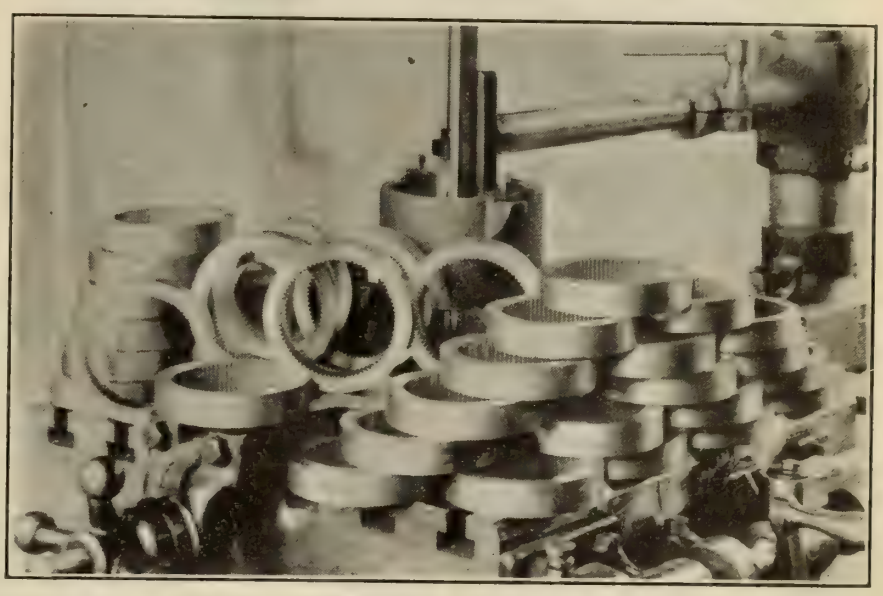
Cutting a 3 in. Keyway in a 16ft½. Propellor



The Modern Keyseater Has Many Refinements—Quick Holding Fixtures are Big Asset—Rotary Tables Help to Speed up Work—Various Examples of Parts Completed on Keyseater

By J. H. MOORE

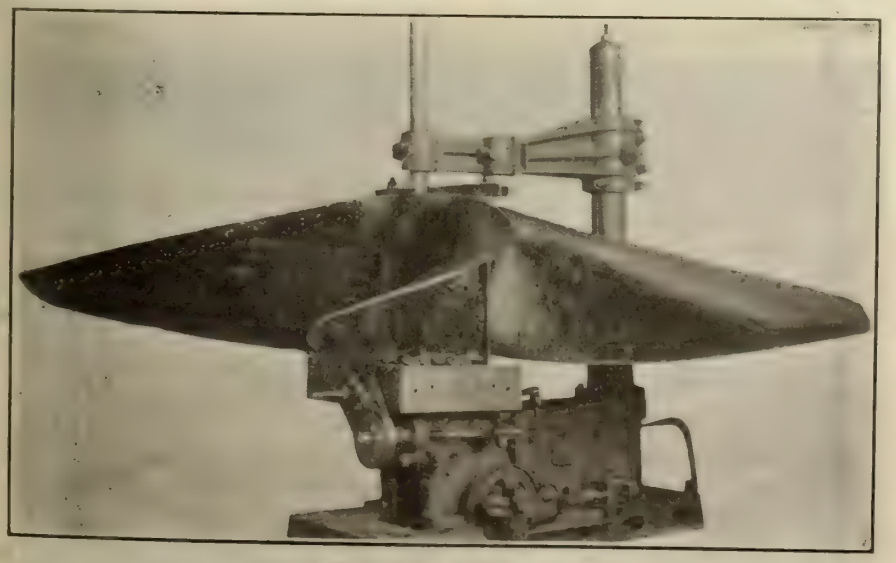
PERHAPS one of the most misunstood machines existent at the present time is the keyseater. Like the hack saw, the keyseating machine has shown wonderful development within the past twenty years. Who would think of comparing an up-to-date rapid cutting metal saw, with the old fashioned frame that slowly and methodically almost rubbed its way through a steel bar?

Of course such a comparison would be ridiculous, and to speak of the modern keyseater as a tool to be used on rare occasions only, is likewise out of all reason. From a small, light constructed, and sometimes inaccurate machine, the keyseater has now reached the point where it can be classed as a production tool. In many plants, batteries of such machines are busy all day long on various work that twenty years ago would have been considered too good to trust to a mere keyseating machine. In other words they have proved their usefulness and adaptability to modern production methods. Through the courtesy of certain manufacturers of such tools we are able to reproduce several jobs which have been successfully completed in manufacturing plants on keyseating machines.

*Photographs through courtesy of Baker Bros., Toledo, Ohio, and Morton Mfg. Co., Muskegon Heights, Mich.

Notching ratchet feed rings on the keyseater.

To enumerate all the various types existent would serve no special purpose, and to go into the question of design would be likewise futile. Various makers claim certain features for their particular product, but in all cases the principle is the same, (i.e.) to pass a cutter through the piece, thus cutting a keyway, or special shaped slot. When special shaped slots are to be cut, it merely means the making of duplicate shaped cutters, which are placed in the standard bar, or if the work is of very intricate shape, a special bar may be used. In any case it does not interfere with the production of the machine itself.



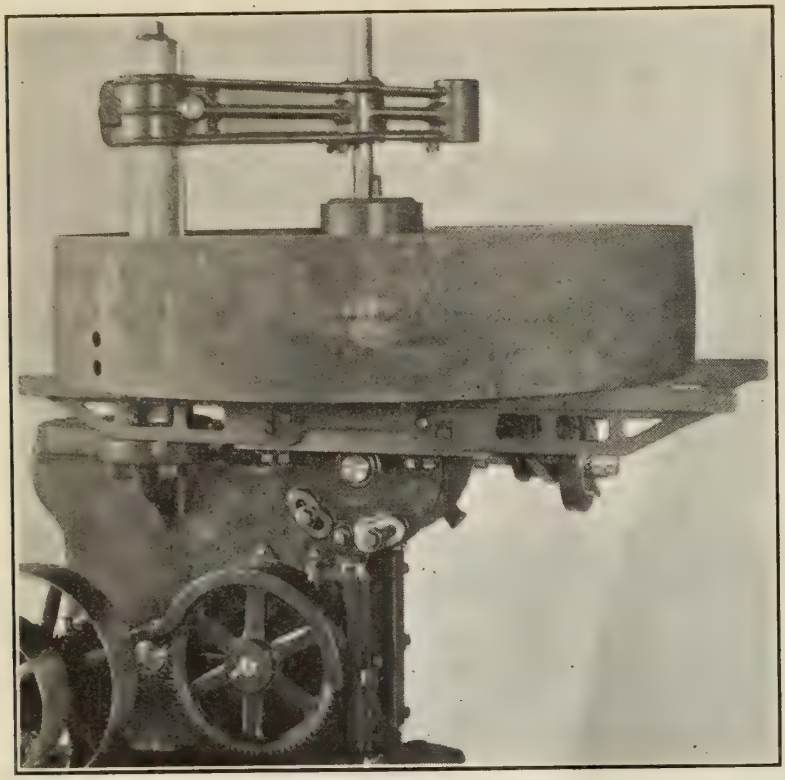


Fig. 1—Cutting keyway in a large propellor.

As a general rule, the modern keyseater is equipped with some type of feed which relieves the cutter on the backward stroke, and which may be set to cut the keyway to any desired depth. Once having been set, the machine is started and will cut any number of keyways alike without further adjustment. Where the keyway is very small, or where there is only one or two pieces completed at a time, the hand method of feeding is usually found to be quite sufficient.

Cutting keyway in a 60 in. pulley.

As stated previously, the modern keyseater embodies certain refinements which the old time machine never could boast of. For example: Gauge plates are used for regulating the depth of the keyway, also for centering the work, while any taper and depth can now be set to very fine limits by means of suitable graduations on the machine. Micrometer adjustment is usually provided on the better class of tools, so that keyways can be set to depth, without the use of a rule or other measuring device.

Even the cutter bars are nothing like what they used to be. Now they are usually made from a crucible-hardened steel, and are so designed that when wear or spring occurs, they can be planed and refilled without much trouble or expense. When small bars are used, the usual procedure is to grip them in a quick action chuck, so that they can be changed quickly and easily.

The cutters are generally made from the finest steel available, because speed is a big factor in the success of such machines. The proper clearance of cutting edges has been carefully considered this eliminating the drag which used to take the place on the old time machines.

Quick holding fixtures have also come into great favor since these tools have been used for production work. In many cases the handling problem is just as important as the machine itself, for if it takes as long, or longer, to handle the piece, as the machine takes to complete the operation, obviously production cannot soar as it should. Thus, to get the most out of a machine, more than the tool itself must be considered. The best and quickest method of handling should first be decided upon, then suitable fixtures should be made to accommodate the parts. The first cost is a trifling consideration, alongside of the ultimate saving. Rotary tables are also used to help speed up the work, in fact devices which tend to increase the production of such machines are being developed every day.

Examples of Work

We have on file many photographs showing ordinary keyseating jobs met with in the common course of events. These include the cutting of keyways in gears of all kinds, pulleys, fly wheels, sleeves, etc., etc., but it is hardly necessary to show these in illustrative form. Let us confine the photographs to jobs a little out of the ordinary and which will prove the adaptability of such tools.

For example Fig. 1. Here we see a keyseater cutting a 3 in. wide keyway in a steam boat propeller which is 16½ ft. in diameter. The propeller is a steel casting, and the total length of keyway is 28 in. It will be noted that a good heavy cutter bar is used, and with the aid of the upper support for the bar, heavy cuts can be taken without impairing the accuracy in any way.

Fig. 2 will give readers a good idea of a very common job in keyseaters, viz, cutting keyways in a pulley, although in this case the pulley is larger than the general run, being 60 in. dimeter. The keyway cut is 18 in. deep, and in the example shown the machine was able to accommodate the larger piece owing to the possible moving of the column. This feature is very desirable when the circumference work would otherwise interfere. With this arrangement it is possible to cut any size or shape within the capacity of machine, and the cutter bar will always be supported above as well as below the work, this in turn insuring accuracy and speed.

In work where the pieces to be keyseated are drilled and bored, they can quite easily be chucked by using centering bushings, thus allowing many pieces to be placed one on top of the other. This holds especially true in such parts as small spur and level gears.

Fig. 3 illustrates a keyseater arranged for notching ratchet feed rings. In this case a special fixture is used to hold the parts in place and the rings are revolved as the machine proceeds with the notching work. Another interesting job for a keyseater is shown at Fig. 4. This depicts a large rack being cut, and the method of handling the part is so self evident that we need not comment further upon it. These last two ideas show clearly that keyseaters are not held down to the mere task of cutting keyways. In fact a machine that is standing idle because there are no keyways to be cut, is not being used correctly. In many cases a ltle thought will relieve some other congested machine, the work being turned over to the keyseater. True, it may have to be handled a little differently, but what of

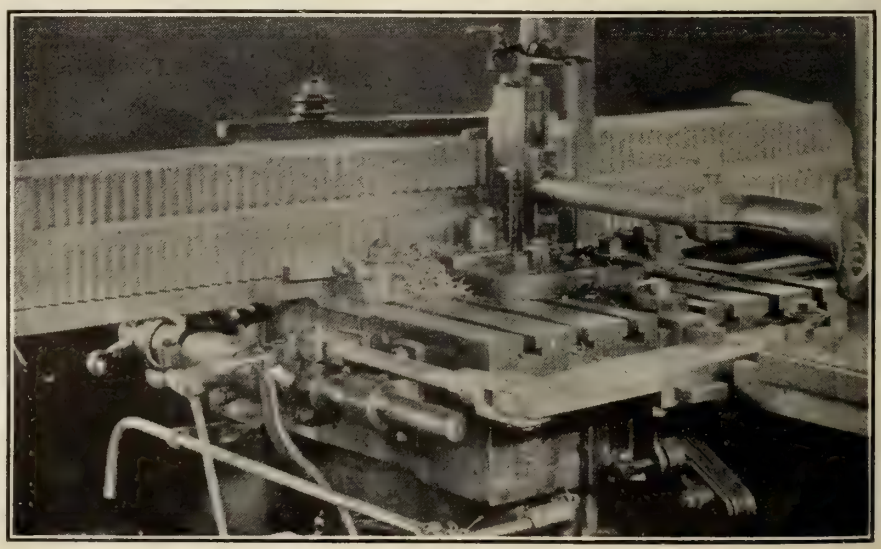

Fig. 4—Cutting a large rack on the keyseater.

that, so long as the parts are produced economically and efficiently.

The remaining illustration shows a rapid binding attachment being used to hold down a gear which is being keyseated. Note the notched rod which permits of rapid clamping, and where the size of the work does not allow the use of such an attachment it is a simple matter to remove it. Like any other machine tool a keyseater cannot produce to its full extent without capable management. The labor used to operate the machine itself does not need to be of highly specialized nature, but to attain the best results, trained mechanics should plan suitable fixtures and attachments to speed up production.

Cornwall, Ont.—The Canada mill of the Canadian Cottons, Limited, has resumed full time. The Dundas Mill of the same company has been working on special orders all summer, therefore has never suffered from any reduction of time.

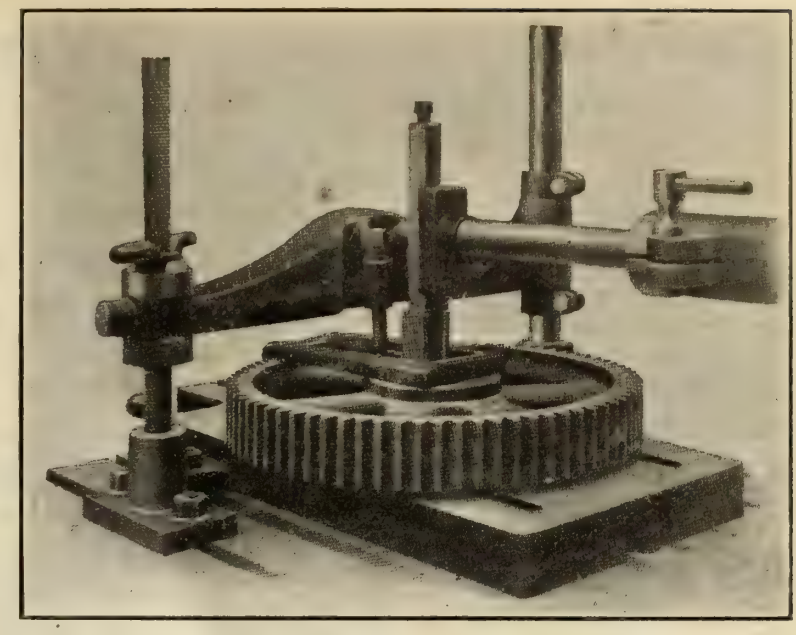

Fig. 5—Showing a rapid binding attachment used in holding down work.

Combination Gear and Cam Drive

By F. Scriber

An unusually compact spur gear, bevel gear and cam drive arrangement that was incorporated in a special purpose machine is shown by the accompanying illustration. It was desired to drive the small bevel gear A, by means of large gear B, thus revolving shaft C, while at the same time operating a slide attached to E, this being accomplished by means of a roll F, which is caused to travel in or out by the groove G cut in the side of spur gear H. The spur gear is in turn driven by a small gear J, revolved by the shaft to which it is held by a key.

It will be noticed that the large spur gear has the large bevel gear attached to one side while the cam is cut in the other side of the spur gear thus all of this mechanism becomes crowded into but little more space than would ordinarily be required for one spur gear.

Following out this drive from the small spur gear J through each movement, it will be observed that J driving the spur gear H causes shaft K to revolve, thus operating one portion of the machine; bevel gear B being held by screws and dowels to spur gear H. This likewise revolves by the same action and drives gear A, and shaft C. As previously described, E is reciprocated by the cam engaging roll F, and thus three distinct movements are imparted to the various units of the machine in which placed.

By keeping in mind such combinations one may often times materially reduce the size of what would otherwise become a large and clumsy apparatus, and the sketch shown is only meant to be suggestive. Part of the construction shown might be applicable to a problem at hand. For instance, the spur gear and cam might be combined as a unit, or the spur and bevel combination would be used at another time.

VALUE OF LUBRICANTS

Solid lubricants, such as mica, graphite and soapstone, have great carrying power at low speeds, but their value depends as much on the nature of the surfaces. Graphite, for example gives the best results when used on cast-iron surfaces, which are naturally very porous and hold the graphite, but the frictional loss and wear are great. Solid lubricants mixed with animal fats, greases, vaseline, or rosin oil are suitable for low speeds and heavy loads, as they give a low coefficient and do not waste away rapidly by evaporation nor run off the bearings. Greases compounded from animal and vegetable fats, or mineral oils emulsified with water soap and alkali enough to neutralize them, are good lubricants for slow-moving bearings with excessive loads, provided the oils do not contain too much water and are not adulterated with foreign substances; the oil should not run down and leave the soap, which is liable to occur in poorly made greases.

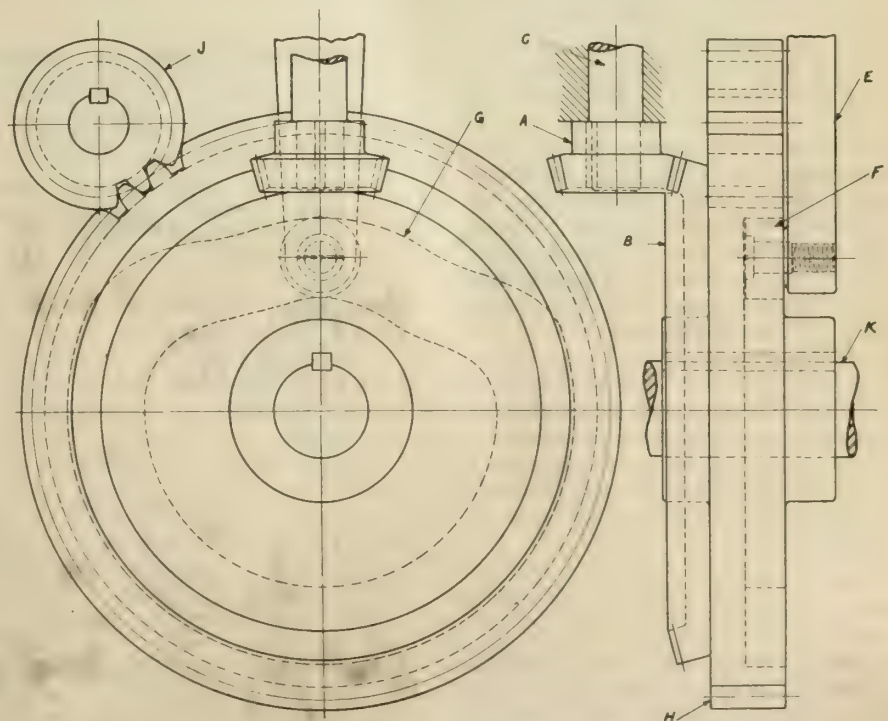

Fig. 7.—Showing the type of gauge described.

Elements of Machine Design—Lesson No. 1

Forces in Machines—What is a Force?—Classification of Forces —Stress and Strain—Elasticity and Elastic Limit—Modulus of Elasticity—Resilience—Working Stress

*By L. T. RUTLEDGE, BA. Sc.

A MACHINE is a combination of resistant bodies or links, whose motions are completely constrained and whose links are so arranged as to transmit motion to some particular part where useful work is to be done. The transmission of this motion gives rise to forces which must be resisted by the various parts of the machine through which the forces are acting.

What is a Force?

A force is that cause which produces the following effects:—

(1) Change of motion or acceleration of a body.

(2) An opposition or balancing of other known forces.

(3) A measurable deflection or distortion in elastic bodies.

The first item relates to kinetics which is that branch of mechanics that treats of the movement of solid bodies produced by forces not in equilibrium, as in the case of machines.

The second item relates to problems in statics, which treat of the laws and conditions of forces acting upon solid bodies at rest, as in the case of bridges and buldings. A force is clearly defined when its point of application, magnitude and direction are known.

Classification of Forces

Forces acting upon machine parts may be classified as follows:—

(a) Useful forces—In doing useful work for which the machine was originally designed: for example, the parts of a drill press must transmit the forces produced by the resistance offered to the cutting tool by the material to be drilled.

(b) Dead weight forces—These forces are present due to the dead weight of the individual parts of the machine. In many designs these forces are overlooked but in many structures such as cranes, or heavy gear wheels on shafting they cannot be ignored. In structural steel work the dead weight or dead load is a very important item.

(c) Frictional forces.—Frictional forces are forces caused by friction between moving parts as in bearings or guides. Where these forces exist, provision must be made for the transmitting of the energy necessary to maintain the force.

(d) Forces due to expansion and contraction—In some structures such as boilers, steam pipes, etc., provision must be made for the forces of expansion and contraction caused by heat. In steam mains expansion joints are provided.

(e) Forces due to change in velocity—Where the direction of motion is constantly changing, as in a connecting rod, or where an acceleration exists, forces are present due to these causes. The design of a flywheel is very complicated on account of the centrifugal forces due to its motion of rotation.

Now it should be quite clear that the designer of a machine must make a careful analysis of all the forces acting from any cause whatever. These various forces should be listed so that all will be provided for. Failures are due to the neglect of this very point.

2:—Stress and Strain

In engineering problems, the external forces acting are usually spoken of as the loads. These loads, coming upon the members of a machine, causes the latter to undergo a deformation or change of shape which is known as the strain. The very instant the strain comes into existance, an internal resistance is set up by the molecules of the material to oppose the strain. As the strain increases, the resistance to it increases until a state of equilibrium is reached. The internal reaction is known as stress. So that the stress may be defined as the internal reaction against the external forces that cause a strain in the material. Forces and stresses are measured by the same units, namely, pounds or tons per square inch. Strain, which is really a stretch, an elongation, or a shortening up is measured, generally, in decimals of an inch.

The purpose of this series of articles, is to provide a short course in machine design, dealing with the fundamental principles involved in the design and operation of machinery. A definite and concise system of reasoning will be suggested for the solution of practical problems.

The course has been designed in the first place, to stimulate interest among any connected with mechanical work, especially such work as draughting, designing, superintending, inspecting, etc., and any who have not received a college or technical school education but who, nevertheless, are desirous of increasing their knowledge in this particular branch of engineering. Many who may have already studied mechanics and machine design will find it advantageous to do some reviewing.

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should any reader wish help in any problem on mechanical matters, Mr. Rutledge will be only too pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

Elastic Limits and Moduli of Resilience in Tension.

Type of Steel		Elastic Limit	Modulus of Resilience
Open-hearth Carbon Steels	.08 per cent carbon	25000	10.4
	.15 " " "	30000	15.0
	.30 " " "	35000	20.4

	Chrome Steel — Oil-tempered	127500	271.0
	Nickel Vanodium — "	126250	266.0
	Chrome Vanodium — Annealed	63.700	67.5
	Chrome Vanodium — Oil-tempered	170.000	482.0

Table 1.

The relationship between loads and stresses is very simple. If a pull of 3,000 lbs. is maintained on a fastened rod, then the stress in any cross section of the rod at right angles to the direction of the forces is 3,000 lbs. If the cross-sectional area of the rod is 3 sq. in. then the unit stress is 1,000 lbs. per sq. in.

Therefore, if "P" were the load acting on a member whose cross-sectional area is "A" then the unit stress "S" $= \frac{P}{A}$

When a body is stressed, there are always, at least, two forces acting. For example, consider a short post resting on a concrete block and let the post be loaded on the top with a weight of one ton. Where are the two forces? It is certain one of the forces is the weight on the post and the other must be the upward resistance of the concrete equal in magnitude to the downward force. If there were no opposing resistance the post would move downwards under the action of the weight and it would keep going till opposed. It is very important to realize fully that there must be, at least, two forces present for equilibrium.

Kinds of Stress

(a) Tensile stress or tension occurs when the opposing forces acting upon a body tend to pull it apart as in the tie bars of a bridge. Then the tensile stress is the internal molecular resistance, cohesion, etc., that acts to resist the separation of the material.

(b) Compressive stress or compression occurs when the opposing forces acting upon a body tend to compress or squeeze it and the particles of the body act to resist the crowding effect.

(c) Shearing stress or shear occurs when the opposing forces acting upon a body tend to cause one section to slide past another.

(d) Bending Stress, or bending, also called transverse stress is a combination of tension, compression and shear and is produced by loading a beam transversely. When the beam bends downwards the top fibres are in compression and the lower ones in tension. The load, in this case, tends to shear the beam in a vertical plane, the shear being maximum under the load. In addition, there is a horizontal shearing stress, brought about by the variation in the vertical shear and other conditions.

(3):—Elasticity and Elastic Limit

Elasticity is the property which a material possesses of returning to its original form and dimensions when the external forces causing distortion are removed. Steel is the most highly elastic material met with in practice. But within certain limits every solid body is elastic and the strain therein is directly proportional to the forces producing it. This is a statement of Hooke's Law. In other words the law states "that unit stress is proportional to unit strain."

The relation existing between the unit stress and unit strain for any material is best given by a diagram or curve, called the stress-strain diagram. The diagram is plotted from observations made when a test piece of the material is subjected to an increasing load and finally broken in a testing machine.

Where E_t = modulus of elasticity in tension

" S_t = unit stress in tension

" δ = unit strain

Then $E_t = \frac{S_t}{\delta}$

Fig. 1 is a stress-strain diagram for a mild steel. The unit stresses in pounds per square inch are plotted as ordinates on the vertical axis, and the unit strain or strain per inch of length in thousandths of an inch. An inspection of the diagram shows how the steel behaves under load. It is seen that up to about 35,000 lbs. per square inch the diagram is a straight line, the unit stress being directly proportional to the unit strain.

At the point "B." the curve departs from the straight line. The behaviour of the beam of the testing machine indicates to the observer when this point is reached. The stress at the point "B." is called the elastic limit. It is the limiting point of perfect elasticity, that is, it is unit stress below which the strain disappears completely upon removal of the load or the elimination of the stress, or in other words, no permanent set can be detected. The point "C." is called the yield point and it is always quite close to the elastic limit. Beyond the point "C" the strain increases at a greater rate than the stress until finally rupture of the test piece occurs. The external load necessary to cause rupture divided by the original area of the cross-section of the bar is called the ultimate strength.

4:—Modulus of Elasticity

In order to determine the strain for any known load acting on a given material, it is very convenient to make use of a so-called modulus of elasticity. It is a factor obtained by dividing the unit stress by unit strain, the stress being not greater than the elastic limit. The value of this factor can, therefore, be obtained for any material from the straight line part of the stress-strain diagram. The slope of the line "A B" in Fig. 1 gives the value of the modulus of elasticity. The slope of a line is obtained by constructing a triangle, having the line as hypotenuse and having for the other two sides two lines, each parallel to an axis of the diagram, that is, have one vertical, and the other horizontal. Then the slope is given by dividing the opposite side by the adjacent. In trigonometry this ratio is called the tangent of an angle. Referring to the figure, the ration is B. D. A. D. Considering the case of mild steel it would be found that for a unit stress of 30,000 lbs. per square inch, the strain would be .001 per inch of length. Therefore the modulus of elasticity would be 30,000 divided by .001 or 30,000,000.

It is very important to know the modulus of elasticity for all metals and materials used in construction. It is a remarkable fact, however, that the modulus of elasticity of every steel is constant, or nearly so, no matter what the grade of the steel.

This is illustrated in Fig. 2. The diagram shows all the steels mentioned to have the same slope and the one straight line in the stress-strain diagram is common for all. Therefore the moduli of elasticity are equal and as was stated above, approximately 30,000,000 lbs. per square inch. The modulus of elasticity is a measure of the stiffness or rigidity of a material and since all grades of steel have approximately the same modulus of elasticity, it is apparent that a piece of soft, ordinary steel is just as stiff or rigid as the most expensive alloy steel of the same size and shape. So that, as far as stiffness is concerned and where strength is not considered and where the shock loads are not present, it is quite good enough to use a low-priced grade of mild steel.

5:—What Factors Determine Strength?

Though one grade of steel is as good as another as far as stiffness is concerned, it does not apply from the standpoint of strength. The quantities that determine strength are the elastic limit stress, the breaking stress, or ultimate stress and the amount of maximum elongation possible. Table 1 gives the elastic limits for a few steels. The elastic limit of oil-tempered chrome vanadium steel is 170,000 lbs. per square inch, which is five times that of machinery steel. The strength of a machine part not only depends on the strength of the material in it, but also on the shape and size of the section. This latter point shall be considered later.

6:—Resilience

Referring to the stress-strain diagram, it is evident that the area under the curve is the product of pounds and distance, the pounds being plotted vertically as stresses and the distances horizontally as strains. In mechanicsthe product pounds by distance, usually feet, is an expression for work or energy. Then the total area under the complete stress strain curve is the amount of energy required to rupture the material, while the area under the curve up to a certain point is the total work required to deform the material an amount equal to the deformation corresponding to the assumed point. If the assumed point be taken as the elastic limit, then the area

under that part of the diagram is the energy known as the resilience. This area in Fig. 1. is represented by the triangle A D B. Since the area of a triangle is one-half the product of the base and the perpendicular height or ½ (A D x D B), it follows

$$\text{That, Resilience} = \frac{1}{2}\left(A\,Se \times \frac{Se\,L}{Et}\right)$$

$$= \frac{AL\,Se^2}{2Et} \qquad (3)$$

In which A = cross-sectional area

Se = unit stress at the elastic limit

L = The length of the specimen

Et = modulus of elasticity in tension

Though the stress-strain diagram is plotted for test piece of unit dimensions, that is, 1 square inch in area and 1 inch long, multiplying by "A" and "L" converts it to suit the case of an actual bar.

However, if the specimen had a cross-section area of 1 square inch and a length of 1 inch, the symbols A and L will have disappeared from the equation (3) and the equation is reduced to

$$(2) \qquad \frac{Se^2}{2Et}$$

4:—This magnitude is the unit of resilience and is called the modulus of resilience. The modulus of resilience is very useful in mechanics of materials for comparing the capacity various materials have for resisting shock. Since the modulus of elasticity is practically constant for all grades of steel, it is seen that the capacity of two steels for resisting shocks varies directly as the squares of their stresses at the elastic limit. For example, the elastic limit of a certain machinery steel is 34,000 lbs. per square inch, and of oil-tempered chrome vanadium steel is 170,000 lbs, per square inch, the latter being five times the former. Then from equation (4), the capacity of the alloy steel for resisting shock is 5 squared or 25 times that of the machinery steel. This point relating to resistance against shock is a very important one for the designer to note.

7:—Working Stress and Factor of Safety

In general the maximum permissible stress induced in a machine member must be kept well below the elastic limit, so that the action of the load may be perfectly elastic. The stress used by the designer in determining the size of the part is known as the working stress. The number of times the ultimate strength contains the working stress is the factors of safety. The size of this factor varies from 4 to 29 with conditions, some of which are listed below. In the case of cast iron, which is brittle and which often has blow holes and bad spots, it is customary to use a high factor of safety, whereas steel which is very ductile and more uniform in structure admits of the use of a smaller factor of safety.

The magnitude of the working stress depends on the following conditions:

(a) Kind of material, quality of it, its chemical composition, elastic limit, ultimate strength, resilience, elongation properties.

(b) Is the application of the load steady or variable, and if variable, does it vary from zero to a positive maximum or from a positive maximum to a negative maximum?

(c) Is the part subject to shock loads?

(d) Is the stress produced from the application of the load a simple stress or a compound one and what kind of stress is produced?

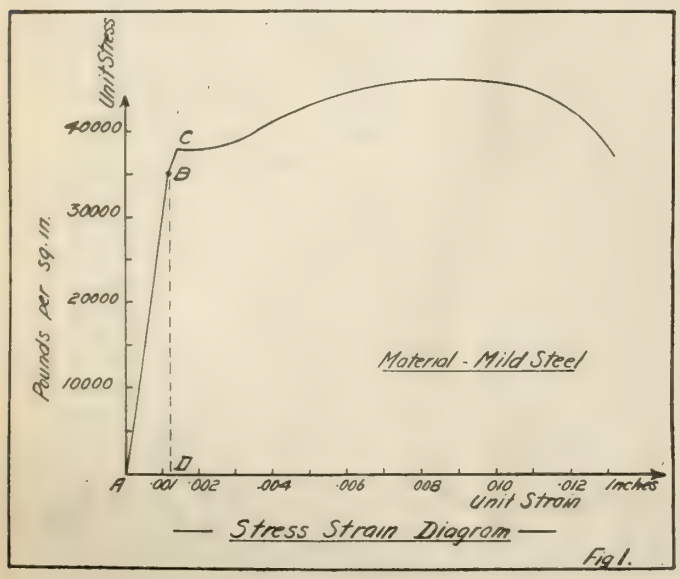
(e) Is the material used in the construction reliable and all the same as the sample tested?

(f) Is the material of the machine part subjected to unnecessary and speedy deterioration?

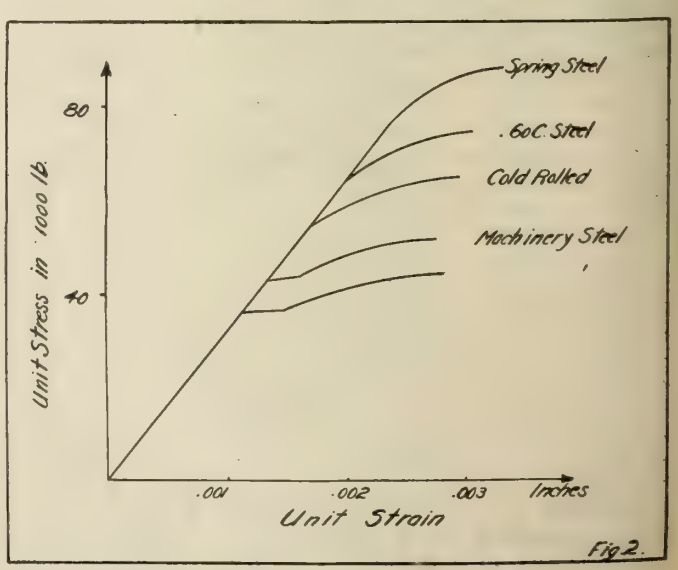
(g) Cost of manufacturing.

(h) The demand on the machine at some future date.

(i) Is human life or property endangered in case any part of the machine fails?



(j) Is the machine to be designed to do a certain work for a short time only and then be scrapped, or is it to be a part of a permanent equipment.



(k) Have temperature stresses to be considered?

OIL FUEL IN 1921

Lloyd's "Register of Shipping" gives the following interesting information in reference to the use of Oil Fuel for ships. In 1914 there were 364 steamers of 1,310,000 tons fitted for burning oil fuel, whereas at present there are 2,536 such vessels of 12,797,000 tons, the amount being more than nine times larger than that of 1914.

The percentage of total gross tonnage using oil, etc., in internal-combustion engines in 1914 was 0.47 and in 1921, 2.0. The percentage using oil fuel for boilers was 2.62 in 1914 and 20.65 in 1921.

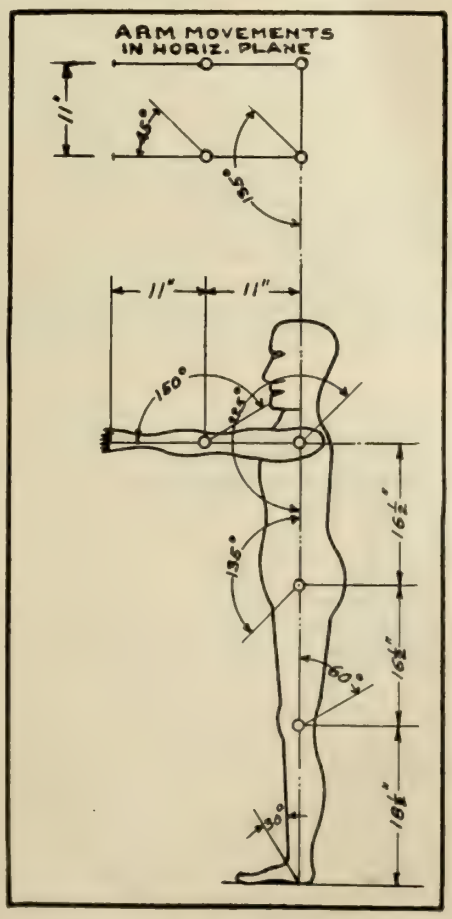
What Muscular Effort is Exerted by Operator?

A Novel Method of Arriving at Muscular Effort—Method of Locating Levers—Working in Horizontal Plane—Pulling in Vertical Plane, etc.

By JOHN S. WATTS

IN THE design of every piece of mechanism the most desirable location for the control levers and handles has to be considered. And to this matter more care should be given than is usually done, as upon the right placing of these levers largely depends the speed with which the machine can be operated. The men who run machines will generally be found to have strong preferences for a certain make of machine, and investigation will show that this preference is largely based upon the convenience of the control of the machine.

Notwithstanding the importance of this subject, there is a singular paucity of data in the technical publications upon which to base muscular effort which can be exerted by the operator of a machine under the varying conditions to be met with. That the designer can decide such questions as the possible reach, and convenient heights for handles, etc., by reference to and measurements of his own body, seems to be the reason for this lack of data, but as few of us are of average measurements, and all machines should be built to suit the average man, it would seem to be desirable to have the measurements and muscular strength of the average man given in some convenient form.



That some dimensions, such as the height of a lathe bed, have become more or less standardised, does not prove that it is in fact the one best dimension for the purpose, and should not deter us from an independent study of its desirability. As an example we may take the height of the sinks in our homes, which were from as far back as we can trace, placed at 28 to 30 inches from the floor, until, someone of a more than usual enquiring type of mind, discovered that a few inches more in height relieved the strain on the muscles of the back almost entirely.

As an example of a case where it is important to know what force the operator can exert when reaching out a certain distance, we may cite the picking belt. This is in essence a horizontal conveyor, upon which the material is carried past a number of men whose duty it is to pick out the impurities from the stream of material as it passes them.

For certain materials the width of the belt has become practically standardised at five feet, which involves the men having to reach over a distance of thirty inches and lift up a piece of material. As the width of the belt determines the amount of material which it can handle, the deciding factor is how wide it can be made, and still not compel the men to reach out so far that they are unable to lift the impurities, without undue fatigue. This weight that can be lifted is also dependent upon the height of the belt from the ground, and to some extent upon the nationality of the pickers, as for example a race of men such as the Japanese, of short stature, would compel the use of a much narrower belt than would be desirable for say the Anglo-Saxon.

Method of Location

The best way to locate the required levers, etc is to sketch in, on the drawing of the machine, a skeleton diagram of the average man, such as is shown in the accompanying sketch, which also gives the maximum movement of each of the most important joints in his body, and from this can be quickly determined the maximum posibilities of movement in his hands and feet to operate levers, without his having to move from one position. While it is not good policy to use the maximum possible movements of the average man, a good idea of the convenience or ease of any given movement may be gained from a consideration of how much this contemplated movement is within the maximum. Also the nearer we come to having the required movement central with regard to the maximum one the better as a general rule.

How's this for a diagram?

The remaining datum that is needed, is the force that can be exerted through each of these movements by the average man working continuously without undue fatigue.

Working in a horizontal plane, as in working a hand lever, we may figure on a force of 35 pounds, pulling towards the body, and twenty pounds pushing away from the body, through a stroke of 30 inches, at the speed of 120 feet per minute.

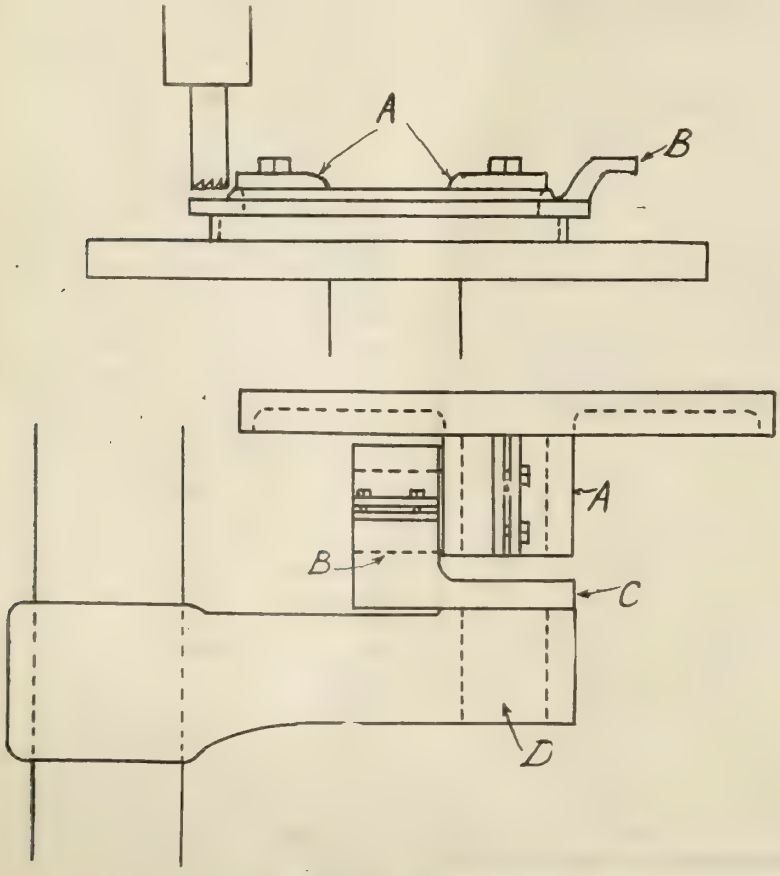
Pulling in a vertical plane, using the shoulder muscles, as in hauling on a rope or chain block, we can count on a pull of 35 pounds, at a speed of 45 feet per minute, that is the rope will travel 45 feet per minute. This may be increased up to a pull equal to the weight of the man, but this maximum can only be exerted for a few moments, and at a very much lower speed.

A complex movement, involving the use of all the major joints of the body, will reduce the available force to 20 pounds, if used intermittently with fairly long periods of rest, or to 10 pounds if used continuously. An example of such a movement is the operating of a hand wheel actuating a clutch or brake, when 20 pounds may be allowed, but in turning the crank of a hand winch for comparatively long periods, we should not expect a force of more than 10 pounds. In both cases the speed will be about 220 feet per minute. The best results for men of average height of 66 inches, are got when the crank handle has a radius of 18 inches, and has its centre of rotation about 30 inches above the floor. The speed of the crank handle may be taken as 55 revolutions per minute.

The weight that can be lifted depends upon its height above the floor, and its distance from the feet of the man. The maximum weight for continuous work, that can be lifted is 40 pounds, when the weight is close to the feet, and not over 3 feet high above the floor. This is reduced to 10 pounds when the weight is 3 feet away from the man.

WHAT OUR READERS THINK AND DO

DRILL PRESS TABLE



By H. T. Osborn

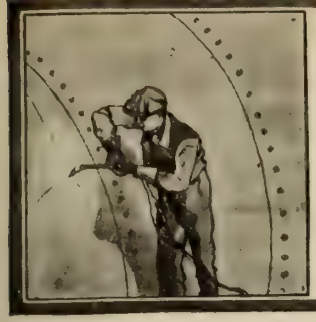
The swivel joint table shown in the sketch will be found very handy for the unlooked for job on the drill press. The casting A is bored to fit the stem of the regular work table, and this casting has a similar shank B which enters the hole in casting C. This casting in turn has a stem on it which fits the hole in the drill table arm at D.

Both pieces are split on one side as shown and are provided with suitable clamping screws. The shank B should be made to fit the hole D also so that it can be used in that position if necessary.

We had a contract recently to make the circular frame shown in position on the sketch. The piece was of brass, had to be turned in several places, and the outside had to be polished. The latter operation was the problem for there were several lugs as shown at B, in the way. We first of all tried filing and scraping but it was too slow.

At last we hit upon the scheme as shown. The work was held by clamps A and located in the centre of the table by pieces bolted thereto. The arm of table was locked to the column, but the table itself was free to turn, this being accomplished by taking a grip over the side of the work with a monkey wrench using it as a lever to turn the table, thus feeding the work to the cutter. The vertical miller would of course have been a better proposition, but as we did not have such a machine we simply had to do the best we could. The main object was to get the surface fairly flat, and get the scale off. Touching up the corners with a file and emery cloth completed the job.

Two drill press kinks that save time.



SHARPENING FINE TOOLS

By RALPH H. BUTZ

Fine files can be resharpened in the following manner. First remove the adhering dirt by means of a fine wire scratch brush, together with a hot solution of crystallized soda, or better still, some warm soapmakers waste lye. Next place the files alongside of each other in an earthen vessel, and on the bottom of the container place two strong wires. This precaution allows the fluid which is later poured in the vessel, to come in contact with the lower portion of the files. Make up a fluid containing a careful mixture of eight parts of cold water to one part of concentrated nitric acid, this to be prepared in another vessel.

Sufficient of this mixture is poured on the files to cover them, when the acid is left to operate upon the files for about twenty-five minutes. After this lapse of time, they are taken out of the bath, treated with a scratch-brush in clean water, similar to the first time. They are next immersed a second time in an acid bath of the same strength, (eight parts water and one part nitric acid), for twenty-five minutes, during which time they are occasionally changed about. The files are then again treated with the scratch-brush, and returned to the same bath, to which one-half part of English sulphuric acid has been added. The bath heats, and reddish-brown vapors escape, during which time the sharpening of the files by corrosion progresses. Care must be had to keep the vessel (the best is an earthen) in a rocking motion, so that the acid operates equally upon the files, which are not to be left longer than five minutes in this bath. They are then withdrawn, again treated, as above stated, with the scratch-brush and clean water, and once more placed in a new bath of the same composition, in which they must not remain longer than five minutes.

This ends the operation. They are now treated with the scratch-brush, first with clean water, and finally they are laid for a few minutes in a bath to which a little lime water has been added. This is for the purpose of neutralizing every trace of acid. They are last of all rinsed in clean water, wiped with a dry rag, and heated to dry the moisture. As a final precaution rub a little oil on them.

WELDING AND CUTTING

Learning to Weld—Points for Beginners

Torch Movement Imported—Beginners Should Concentrate On One Kind of Welding Until Proficient—Beveling—Preparation of Thin and Thick Metal Sections for Welding

*By FRED E. ROGERS

BEGINNERS should commence by welding strips of low-carbon steel from 1-16 to ⅛ inch thick, using a No. 2 tip. Thin gauge metal can be welded without using welding rods or beveling the joint. The strips should be laid on metal supports or preferably firebrick resting on a metal plate. Never attempt to weld on a wooden top workbench without protecting the planks from the torch flame.

The torch should be given a slow zig-zag motion across the joint, holding it slightly inclined sideways so that the flame strikes the metal at an angle in the direction of the joint. The torch movement should extend about ⅛ inch each side of the joint. The forward movement along the joint will depend on how quickly the metal fuses and welds together. In no case, however, should the flame be directed against the metal without motion, as it will be overheated if the flame is not kept constantly moving.

As the metal fuses the motion should be maintained keeping it in step with the melting metal, going no faster nor slower. The operator will experience difficulty at first in seeing just what is taking place when looking through colored glass spectacles or goggles, but ability to distinguish between the melted and unmelted metal will come after some practice.

It will be realized that correct torch manipulation requires considerable muscular training and the operator will find the practice tiring at first. The weariness comes more from mental exertion than muscular effort, however, and after a few days the operation will no longer be irksome.

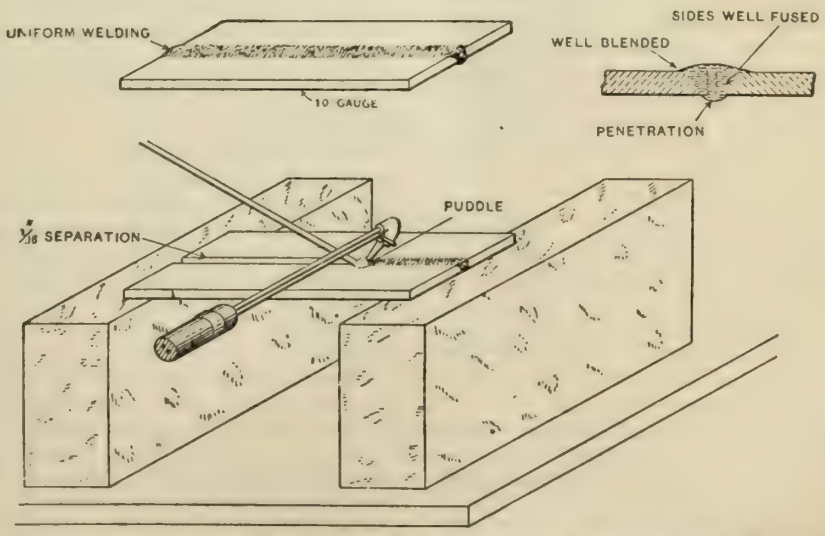
Beginners should concentrate on one kind of welding until they are able to produce fairly satisfactory work. Avoid experimenting with various kinds and thicknesses of metal until satisfactory proficiency has been obtained with one gauge and kind of metal only. Study to learn principles in the beginning and endeavor to do one thing well at a time.

*Extracted from a book entitled "Welding and Cutting," which is published by the Davis-Bournonville Co., Jersey City, N. J.

Holding the Torch.

The torch should be grasped by the handle in the right hand, at or near the point where it balances with the hose hanging free. It should be held across the joint and worked back and forth in this direction when welding. Always hold the torch with the tip down and avoid flourishing it around. The flame is very hot and will instantly set fire to clothing or other combustible with which it comes in contact. Severe burns will follow exposure of the flesh, if but for an instant, to the direct flame.

The point of the white-hot bulb or cone should be held touching the metal or from 1-16 to ⅛ inch above it, dependent upon the size of tip in use and the metal being welded. Care should be taken to hold the torch uniformly at the prescribed height. Touching the tip to the metal will obstruct the flow of gas, and it may cause a flashback in the older types of torches and tips, that will continue to burn within the tip head and soon ruin it if not checked. In case of a flashback turn off the oxygen needle valve immediately, relight and adjust as before.



The operator should learn to stand easily and hold the torch in the hand so as to control its position and motion without tightly gripping the handle. When welding, the flame should not be held steadily in one place but should be kept in constant motion, the movement depending on the character of the joint and the thickness of metal as before stated.

One of the first things for an operator to learn is to have confidence and not be afraid of the apparatus. If the torch backfires, seek out the cause of the trouble and correct it. It is rarely that a flashback extends further than the head of the tip, and if the oxygen is immediately shut off no damage should result.

Go through the motions of turning on the gases, adjusting the working pressure, lighting the torch and regulating the flame until the order becomes fixed in mind and automatic.

The Puddle.

Beneath the torch flame is a pool of molten metal known as the "puddle." The size, heat and condition of the puddle are what determine the success or failure of welding. Learning to weld

Welding Prepared Joint showing Welding Rod, Firebrick and Cross Section of Weld.

is largely a matter of seeing the puddle clearly through colored glasses, understanding what is going on and being able to correct the defects seen.

When welding steel the puddle should lie clean and clear, having no foam on the surface, and "wetting" the sides of the groove in which the weld is being made. Anyone who has soldered a joint knows the difference between the molten solder that amalgamates or unites with the parts to be soldered, and that which persists in a spheroidal state, refusing to unite with the metal and standing on the surface with rounded edges. So long as the spheroidal or rounded edges persist in the puddle the welder should know that he is not making a sound weld. He is not securing penetration and union of the adding material and parent metal.

The remedy with steel is usually more heat to melt the oxide but when welding cast iron the oxide in the puddle which interferes with penetration cannot be eliminated except by the use of a flux that reduces it.

The welder's training should enable him to tell immediately when the puddle conditions are right, whether too much or insufficient heat is being radiated to it by the flame, when it is properly located and if the condition of the metal is such as to need clarifying by the use of a flux.

Leaks in the Torch Head

The seat of a D-B torch head is reamed to a standard angle, and the tips are carefully turned to fit. No trouble need be apprehended from leaks when the torches are new, but after a period of use the torch if misused may become distorted in the head to such extent that the tip seat no longer fits closely, the result being that the gas leaks and catches fire, burning around the tip nut. The welder should immediately correct this trouble if possible. While it is not necessarily a source of danger, it represents waste and interferes with good work. Removal of the tip may disclose the leak to be due to the presence of a foreign substance which removed obviates the trouble. If the cause is due to distortion it may be necessary to return the torch to the factory for refitting. Minor troubles of this sort may sometimes be overcome by grinding in the tip with oil and sifted powdered glass. Care should be taken to clean out the cavity and the gas holes thoroughly afterwards to prevent clogging the tip.

Flashbacks

The following regarding flashbacks applies to the older torches made before all the principal causes of flashbacks had been found and eliminated. Non-flashback tips are now furnished for all style C torches, which are free of this trouble when used under reasonable conditions of service.

Flashbacks in the older torches are troublesome to the beginner and are likely to be more or less frequent with any operator depending on the skill or lack of skill with which it is used. Any torch will develop a flashback if held with the tip so close to the metal that the flow of gas is obstructed, or if an obstruction is slapped against the end of the tip. Flashbacks also result from overheating. The beginner should learn first of all to avoid holding the tip too close to the work and to prevent the tip or head becoming hot. No trouble is experienced from overheating when welding thin gauge metals, but on heavy welding of preheated parts it may become serious and require frequent cooling by plunging the tip and torch head into cold water. Water-cooled head torches are used on heavy preheated parts, or the special No. 37010 non-flashback torch with long curved tips.

Flashbacks may be caused by insufficient acetylene pressure or the presence of an obstruction in the tip. Particles of metal sometimes fly up and stick to the tip partially shutting off the opening. Hence the operator should remove the obstruction either outside or inside the tip and see that his gas pressures are correct for the size of tip used.

Care should be taken to prevent the hose becoming kinked or pinched as this will reduce the flow of gas and may cause a flashback or improper flame adjustment.

Preparing for Welding

Acceptable commercial welding is produced by proper and thorough preparation of the parts before actually undertaking to weld. By preparation is meant cleaning, beveling the edges to be welded, lining up, preheating in the case of castings to produce expansion and to counteract the effects of contraction, providing sufficient supply of gases and welding rods and starting work at such time that it can be finished in one heat. Work should not stop on a weld until it is finished. Hence, making ready for welding means planning to finish it without interruption.

Cleaning Parts to be Welded

Remove all rust and scale from the edges to be welded. The time spent in cleaning a joint, removing all foreign matter will be well employed. Never undertake to weld parts covered with grease without cleaning them if for nothing more than comfort of operation. Remember that a weld should be kept free of everything except the weld metal and flux. Anything else interferes with good work.

Heavy grease and thick oil may be removed by the use of scrapers and waste soaked in kerosene. The addition of 5 to 10 per cent. machine oil to kerosene makes it more effective as a cleansing agent than the clear kerosene. A wire scratch brush is good for removing scale and rust as also are old files ground to a chisel edge. Care should be taken to have large parts thoroughly dry and free of oil before starting to preheat. The heat might gasify the grease and cause a puff or an explosion in a confined space of sufficient force to knock down a loosely laid brick furnace around the parts and thus cause considerable loss of time and annoyance.

Beveling

Following usual practice, wrought iron, steel, cast iron and other metals in general, thicker than ¼ inch are beveled on the edges to an angle of about 45 degrees, preparatory to welding. Thus, an included angle of about 90 degrees is formed when two beveled edges are butted. If the parts of an iron casting are thicker than, say, two inches and it is possible to weld on both sides the bevel may be cut to the middle only. Less labor will be required to make the bevels and less welding rods and gas will be needed for the weld.

A wide variation in practice is allowable in beveling steel plates. While it is generally agreed that the edges should be beveled it may not always be absolutely necessary, however. Two square edge plates may be successfully welded by tacking them a distance apart approximately equal to the thickness of the plate. The welder must then break down the corners thus forming a groove in which the adding material is puddled and welded in the same manner as though the joint had been mechanically prepared. Of course, it is better to bevel mechanically than by torch manipulation. Recommended practice for tanks and drums is beveling the edges of the plate to an angle of about 45 degrees before rolling into cylindrical form. The edges for the longitudinal and girth seams are then presented in the form which requires the least torch manipulation to produce dependable welds. It is not necessary that the bevels be carried clear across the edges so as to make a sharp angle, but a thickness of 3-32 to ⅛ inch may be left square at the bottom. Less metal will be removed and there will be less danger of overheating the metal at the bottom.

A variation in practice worthy of consideration in firebox patching is beveling to sharp angle in the conventional manner, and then hammering or otherwise bending the edges over slightly. In this manner the danger of overheating is reduced but of more importance is the somewhat greater elasticity of the joint to contraction stress as the weld closes.

Thin metal especially sheet aluminum should be prepared for welding by turning the edges up to a 90-degree angle. The weld is made by fusing the turned-up edges which unite and sink down approximately flush with the plate.

Cutting Bevels

Bevels may be cut rapidly in steel and wrought iron with the cutting torch and at low cost as compared with hand chipping, grinding, sawing or filing. In manufacturing plants it is feasible to cut bevels of plates with a planing machine and to turn the ends of flanged pressure container heads in a lathe to the required angle. Cutting-off machines may be used to cut pipes and bevel at the same time. Cast iron may be beveled with hammer and chisel, emery wheel, hacksaw or file, also with cutting torch fitted with a tip for cast iron cutting.

To be Continued

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

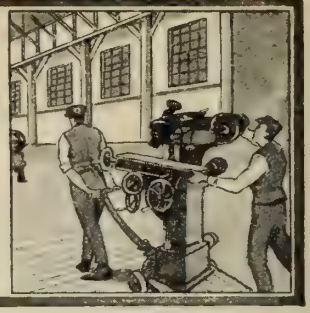
We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Two readers submitted lists for the Sept. 15th contest, these being T. Parkin, and J. H. Wood. Mr. Parkin resides in Montreal, Mr. Wood in Toronto. In the elimination test Mr. Parkin was lucky enough to have his paper selected. Stay with it Mr. Wood, next week may be your lucky one.

CONTEST FOR OCTOBER 6TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1—Something that is reversible.
2 How to reduce cost of fabrication.
3 Something alloyed by a S Process.
4—How to save space, light and fuel.
5—Certain points to keep in mind.
6 What to use to increase production.
7 A product built to stand rough usage.
8—Something that has been proven over and over again.
9—How to make heavy lifting easy.
10—Something that can be done in a few minutes.
11—How to secure accurate production.
12—Something that is fire resisting.



These are Correct Answers for List from September 15th Issue

1—Nicholson File Co.
2—Bilton Machine Tool Co.
3—Henry Berry & Co., Ltd.
4—The National Acme Co., Windsor, V. T.
5—C. E. Johansson, Inc.
6—Brown, Bogg Co., Ltd.
7—Crane Limited.
8—Pratt & Whitney Co., of Canada.
9—The Ford Smith Machine Co., Ltd.
10—Algoma Steel Corporation, Ltd.
11—The L. S. Starrett Co.
12—S. F. Bowser Co., Ltd.

Closing Date for This Contest is October 27th

DEVELOPMENTS IN SHOP EQUIPMENT

NEW TAP GRINDER

The Bickford-Switzer Co., Greenfield, Mass., have placed on the market a new tap grinder. This machine is designed to sharpen any style of tap, having any number of lands or flutes from two to six inclusive, by grinding an eccentric relief on top of the cutting land, the limit of capacity being 1½″ in diameter for hand taps, 1¼″ for tapper or machine nut taps, and 2″ for pipe taps. The machine grinds the different lands of the tap consecutively, a cam on the main or work carrying spindle riding against a positive shoe, thus causing the tap to approach and recede from the wheel as it is revolved on its own centres.

The squared end of the tap is driven by a bell centre of the ordinary type, while the point is supported by a male or female centre as required, these two centres being made on a revolving plate which also provides for remaining out of the way to give space for inserting the shank of any long tap that it is necessary to hold in the chuck. The different cams are made together in a single shell and mounted on the work spindle so that when the spindle is turned in a backward direction the cams do not revolve, but will start forward from any position when the spindle is turned forward.

This arrangement is made to assist in setting the tap to bring the proper relative position between its cutting land and the cam.

In order to do this it is only necessary to turn the tap backward until the contact point of the wheel is in a position between two tap lands and then turn the tap forward.

The head which carries the main spindle is arranged to clamp in the desired position on the rocker shaft, a flat spring underneath holding the head over to keep the particular cam in use in contact with its shoe. A small cam shaped collar is conveniently arranged to force a shoe into contact with whatever cam it is desired to use. The machine is also designed to sharpen countersinks and chucking reamers, if they are of not more than six flutes.

A lever at the left feeds the work forward to a position opposite the wheel when a lever at the right sets it to the desired angle, and the wheel is fed in as the work is revolved by means of the crank. A special feature of the machine changes the angle of the work as it passes the wheel, giving a rounded contour where the angle of the bevel near the end of the tap approaches the parallel sides. This is said to prolong the life of the tap, taking off the point of the tooth that projects on one land when the tap is sharpened by ordinary methods, and it is claimed to be equally valuable when sharpening chucking reamers, saving the use of a hone to take off the sharp corner.

PRECISION LEVEL

The Universal Boring Machine Co., Hudson, Mass., has just placed on the market a precision machine aligning level.

The design and construction is said to be different from previous levels. The frame is of cast iron, truss construction of sufficient strength to eliminate strains. The levelling surface is 27 inch long, which is claimed to be longer than the majority of precision levels on the market. The vial used is the best Jena Glass, especially ground, and is filled and guaranteed by a leading level maker. It is set in a brass japanned case which in turn is mounted on two lacquered brass studs one at each end. After adjustment the vial is locked by two nuts working against each other. The adjustment also has a cross travel. This ensures all adjustments similar to those on the finest surveying instruments.

The bubble in the vial has a guaranteed sentitiveness of 5 seconds of arc per graduation, equivalent to 0.0002908 of an inch per foot. The vial is carried in such a manner that protection from breakage is assured. The level casting is thoroughly insulated from the palm of the hand by means of a handle of non-conductive material. Distortion from this source is thus eliminated. The casting is first planed and drilled and allowed to thoroughly season. After the metal has proved its season, the base is hand scraped and tested. It is then allowed to rest for a period and is tested again. The vial is then adjusted. The instrument is finished in dull black, and a durable felt lined mahogany case protects the instrument. This is equipped with a strong brass handle thus enabling the instrument to be conveniently carried by service men on the road as well as a convenience for use in the shop. The weight is 9¾ pounds.

IMPROVEMENT TO SURFACE GRINDER

Several new features are incorporated in the line of Pratt & Whitney vertical surface grinders of the moveable platen type. Here are a few of the changes:

The ball bearing mounting of spindle has been completely redesigned, weight of the wheel unit being carried on springs set against the upper bearing. This provides an automatic take up so that no adjustment for wear is necessary. All openings are carefully guarded from grit and moisture by the interlocking construction of the parts. Lubrication in the upper section is provided for, the oil dripping from regulation oilers through the bearing and falling into whirling cups which throw it back into the bearing by centrifugal force.

In the lower section the oil is poured into a large reservoir, flows through the upper bearing and runs along the spindle to the lower bearing, the grinding wheel face plate acting as a retainer and ribs in this plate throwing the oil continually up into the bearing by centrifugal force.

An aperture in the column with a removable cover provides easy access to the spindle counterweight. The table drive has been strengthened by hardened shafts, gears and clutches, amply lubricated from sight feed oilers on the front of the case. The entire drive shaft unit may be easily removed as split bearings are now used.

Hand operation of the table has been simplified by providing a sliding gear in place of a clutch on the hand wheel shaft. The table reverse is assured of smoother action by means of a dwell in the pinion drive so that the table comes to a stop before reversal takes place. This practically eliminates shock of "jumping" and protects the clutch mechanism. The feed shaft has been fitted with a keyed coupling for easy removal of the main drive unit.

The idlers over which the main drive belt runs have been equipped with roller bearings lubricated by extra large grease cups in the ends of the stationary shaft. Frictional power losses are minimized and smooth running is assured. The spindle drive pulley is surrounded by a heavy sheet metal guard. The tank has been redesigned after numerous experiments. A series of baffle plates cast integral with the tank proper are provided with openings alternately at the top and bottom so that the solu-

tion flows over and under these plates in such a manner that in the last compartment where the solution is drawn off by the pump, a clean "free from grit" solution is obtained.

Cleaning the tank is a simple matter as the settling pan can be lifted off giving accessibility to all compartments. To add to the oil retaining capacity of the main drive cone at the rear, the hollow stationary shaft (keyed to the bracket) is supplied with grooves packed with felt. These grooves are connected to the centre oil hole.

The motor drive has been improved by making the motor base adjustable so that the drive belt can be adjusted correctly in relation to the step of the main drive cone. This prevents creeping and curling in the corner. The drive for the rotary tilting chuck (plain and magnetic) is now equipped with a flexible coupling which facilitates mounting.

This equipment can be easily mounted at any future time in case the machine is not so equipped when purchased. The demagnetizing switch has been improved to make the current reversal positive, quick and smooth.

SPRING PRESSURE ATTACHMENT

The E. W. Bliss Co., of Brooklyn, New York, have designed and marketed a combination spring pressure attachment for combination dies. This combination toggle joint spring pressure attachment presents to users of combination dies, particularly where lithographed metal is handled, advantages not to be had in the ordinary spring pressure attachments now in general use. It insures uniform drawing pressure on blank during the entire draw, producing a more uniform edge. The uniform pressure increases efficiency by minimizing strain on the metal, reducing wrinkles, breakage and wear on dies. The application of the toggle motion, in addition to giving a uniform pressure, reduces the total rubber or spring compression materially.

The strain on the press is reduced and a positive saving in operating power saving is made by the elimination of accumulative spring pressure. The reduction of compression adds considerably to the life of the rubber or spring.

Reduced compression allows the economical manufacture with combination dies of shells deeper than heretofore practical. It is possible by the use of the attachment, to reduce the number of operations where there is reducing operations to follow the first cutting and drawing operation. You also can make in combination and reducing dies certain work which formerly required double action dies.

Another advantage is that the reduced spring or rubber compression means proportionate reduction of "back-lash" of the press on the upstroke. The attachment does not interfere with the operator and dies can be removed the same as with the old style attachment. To install there is no change necessary in the press equipment. The new fixture is built in four sizes for standard Bliss presses, and the depth of draw obtainable on various sizes is as follows: No. 18 Press 1¼ inch depth of draw; No. 19 Press 2 inch; and on No. 20 press 2½ inch.

To obtain the maximum draws, given presses must have same stroke and die space as necessary with the old style attachment. While it is possible to draw in one operation a shell of greater depth than with the old style attachment, it should be understood that to get the maximum depth of draw, correct working proportions between diameter and depth of shell must be maintained.

NEW PRECISION INSTRUMENT

There has been recently placed on the market by the Young-Fischer Inclinometer Co., of Minwaukee, Wis., a new instrument known as an Inclinometer intended to take the place of the plumb, level or protractor in mechanical laboratories, machine shops and in all building operations where angles are to be determined, and particularly where extreme accuracy is rquired.

The Inclinometer is said to be a fully designed tool consisting of a machined case of cast metal containing an accurately adjusted gear train driven by gravity impulse. The hand on the degree dial moves in unison with the multiplying gears causing the minute hand to make 36 revolutions while the degree hand is making one revolution. The multiplying effect of the gear train is such that the instrument gives angle readings in degrees and minutes with accuracy corresponding to that of a single dial Inclinometer having a dial approximately ten feet in diameter.

CYLINDER RE-BORING TOOL

The International Purchasing and Engineering Co., Detroit, have marketed a reboring tool which is fitted with an individual motor drive. The motor is mounted as a part of the tool, no flexible shaft being employed. A friction clutch is incorporated between the motor and the tool, so that slippage is possible in the event that the cutter head becomes wedged, thus protecting the motor. The final drive is through a hardened worm wheel running in oil. Without making any disconnections, it is stated, the tool can be operated by hand or by the spindle of a drill press. The tool has a range of from 2¾ to 5-16 in.

The machine contains various features, including a solid hardened and ground feed bar that has no thread; heavy bearings 10¼ in. long; a tapered arrangement for fitting the boring head in the feed bar; six high-speed-steel blades, and a quick return feature that allows the boring head to be brought instantly to the starting point, also the elimination of split guide rings.

What Can We Do to Help?

THE WEEK commencing October 9th, will be generally observed throughout both Canada and the United States as "Fire Prevention Week." The success of this annual campaign does not depend entirely on those responsible for the propaganda work, but the onus of responsibility dests equally as heavy on every man, woman, and child in the country. Very few people realise that over $300,000,000 goes up in smoke every year, or that each year sees an average of 18,000 lives lost through fire. On top of this alarming total, the figures show that some 60,000 persons suffer bodily injury in varying degrees. The stupendous amount of damage caused by fire should make people more careful, but unfortunately they do not seem to profit by experience as they should. It is this fact that makes fire prevention weeks essential.

The total fire loss in Ontario for 1920 amounted to $11,771,718. The loss to manufacturers alone was $3,508,524. This alarming total represents 483 fires, in other words. an average of $7.264 per fire. The causes of such conflagrations make interesting reading. Friction caused 38 fires, with a resulting loss of $299,312; electricity 618 fires with a $943,616 loss; stoves, furnaces and boilers 1014 fires with $895,341 damage; spontaneous combustion 16 fires, having a loss of $717,268; steam and hot water pipes, 5 fires, with a loss of $12,827; smoking 556 fires causing damage to the extent of $390.038, while rubbish and litter was the means of creating 179 fires with a damage bill of $162,760. These figures cannot be denied. They stare us in the face, and should stir us to greater effort to stamp out this seemingly constant evil. How can we cope with the situation?

During fire prevention week, lithographed wall hangers will be scattered broadcast over the country. These will reach schools, libraries, factories, etc., and will be placed in every town an dvillage, even to the very smallest. In addition to this, suitable booklets, placards, letters, and other miscellaneous literature will be sent to all branches of the industry. The pupils of the public schools, colleges, and universities, will receive medals for essays on the subject of "Fire prevention in the home and factory," and many other education features will be inaugurated. All these movements are very essential and will accomplish much good, that is, IF WE, as true citizens of Canada. do our part in making the campaign a success.

Let the mayors throughout the country issue proclamations, calling the attention of merchants, manufacturers, and home dwellers to the danger of fire, and means of prevention. Let us individually start a clean up movement, getting rid of all rubbish. Clean those chimneys that should have been done long ago, see that factory aisles are kept clear, and that no oily waste is left lying around. Get away from the habit of throwing matches carelessly around, and see that all electric wires are well protected. Do not give the demon of fire a chance to show his head. Smother his activities, and the best way to accomplish this is by exercising care and judgment in the prevention of such a danger.

Architects, engineers, and contractors, know quite well that structures can be built which are firepoof in almost every particular. They know that in such a building a fire could be speedily extinguished. yet how many firms are short sighted enough to leave themselves open to the fire danger by using some old structure that is nothing short of a fire trap.

All these changes for the better cannot happen at once, but by constant plugging, we can at least improve conditions day by day. Let us decide to forget the term "Fire Prevention Week," and make instead, each succeeding day one of bigger and better effort in stamping out of the fire evil. We are told that eternal vigilance is the price of liberty. We naturally wish to be free from the fire hazard, and there is only one road to freedom. We must combine our efforts, each branch of the various industries doing their own especial part. It is another case of "United we stand, divided we fall." The campaign about to commence will not be the success it should, if we do not get behind the movement as a nation. Make up your mind to be a booster of fire prevention. Do not merely talk about it, but act as well. If everybody will do this we will soon be able to practically disperse with our present fire fighting forces.

Cheaper Means of Transportation

CAN you imagine an automobile made from cotton, and driven by power generated from coal dust? Personally, we cannot picture such a means of transportation, but Roger W. Babson, head of a statistical organization in the United States, claims that while such radical departures in the design of automobiles may not come immediately, they are within the realms of possibility.

Speaking further on the subject, Mr. Babson says:—

"The principal factor in the decline of the automobile industry has been the steady increase in the price of gasoline. The car of the future will be run by other fuel. Already, the use of coal dust has passed the experimental stage. In my opinion it will be used extensively within a short time.

"Lighter cars must be manufactured in order to cut down the cost of manufacture and maintenance. Steel is too heavy for use in automobile construction and aluminum is too expensive. A composition of cotton, glue and formaldehyde is being used to produce a material that may solve the problem. Paper pulp, formaldehyde and glue are now used in making tubs, buckets and other articles. By substituting cotton for paper, the strength of the composition is enormously increased."

When one considers the modern and efficient methods employed in the production of the present style of automobie bodies, it is questionable, even should Mr. Babson perfect a cotton body, whether he could produce it much cheaper than at present. Were we inclined to be of a so-called humorous trend, we could elaborate on the trials which a cotton body would go through while a beginner mastered control of his car.

Powdered coal as a motor fuel sounds more reasonable than the cotton type of body. Experiments have been progressing favorably with powdered coal, although to our mind, this form of fuel will never supersede the present liquid form. Gasoline will no doubt be replaced by some other liquid that will sell cheaper, but it is doubtful if this will occur for quite a time as experiment for a gasoline substitute are still in their infancy.

MARKET DEVELOPMENTS

Steel Production Expected to Increase Shortly

Sheet Industry Is Operating at About 75 Per Cent. Capacity—Wire Mills are Running at 50 to 75 Per Cent.—While Tin Plate Mills are Fully Double the Rate of Last July

THE PRESENT market situation continues to show signs of renewed activity. While we cannot report any substantial business, we can truthfully say that if enquiries are any guide to go by, business is about to be placed. Some of these enquiries may take time to develop while others again look like real orders in the very near future.

Pittsburg reports that the sheet industry has reached the 75 per cent. production mark, and that oher mills also show a considerable increase in this respect. The steel ingot production however is only 33 to 35 per cent. of capacity. Steel production is expected to increase during the next few weeks.

15,000 tons of foundry iron has been purchased by a large American concern. The price paid for this material varied somewhere but foundry iron is quoted around the following figures. Bessemer $20; $19.25 to $20 for basic, and $21 for foundry, f. o. b. valley furnaces; the freight to Pittsburg being $1.96.

Machine tools are not especially active. Second hand and re manufactured tools seem to be more in demand than the new machines.

The small tool market plods away at its regular gait, and the scrap situation can well be said to be asleep at the switch. Nobody seems to interest themselves in the latter market and no improvement is looked for at present.

SHEET INDUSTRY IS OPERATING AT 75% CAPACITY—OTHER INCREASES

PITTSBURGH, October 6.—The great decline in steel prices having very nearly ended last July, while in the past three or four weeks wire products and sheets have definitely advanced, the three "heavy rolled products," bars, shapes and plates, are now the center of interest in the matter of prices. The demand for these products, in proportion to the productive capacity has been much smaller than the demand for lighter products, including wire products, sheets, tubular goods and tin plate, otherwise they would have experienced little difficulty in striking a low point in price and then rebounding. A demand would help both movements. A decline would be facilitated, for when there is open competition it is through large inquiry, not by miscellaneous carload buying however extensive, that prices are pushed down, while when mills become reasonably well filled up prices rebound with no effort.

For a couple of weeks past it has been evident that some of the producers, including the Steel Corporation, have been making a particular effort to round up tonnage in bars, shapes and plates in the hope of so strengthening their position that they could put up prices. It looks now as if the movement will be a success in the very near future. Repeatedly in the past few months the Steel Corporation has officially stated that it is meeting competition, and thus it cannot have formal prices, rigidly adhered to. For it to do that would be simply to "hold the bag" for independents. A peculiar announcement was made as to the Steel Corporation on September 26, to the effect that its prices were 1.65c on bars and $1.75c on shapes and plates. The peculiarity was that it was not plain whether such prices meant an advance or a reduction. There had been no formal statement as to prices since the corporation announced 1.75c on bars and 1.85c on shapes and plates. From this viewpoint the new prices would be a reduction of $2 a ton. From prices the corporation and others had actually made on sales, 1.60c and occasionally less, the newly announced prices would be an advance. At the moment the condition seems to be that the majority of sellers, including the Steel Corporation, are making a strenuous effort to book orders with the intention of firming up as soon as possible to 1.65c for bars and $1.75 for shapes and plates as absolute minimum. In most cases orders only are accepted, with specifications attached, though the seller is willing to distribute deliveries, not requiring the buyer to take deliveries, as fast as the mill could make shipment. While the fact is not admitted, it is possible that some of the independents would take business without the entire tonnage being actually specified at the time.

Turning Point in Prices

All that has occurred in the finished steel market lately is along the same line, that a turning point in prices has been rounded. The long decline is over and prices are getting on a better basis. It does not follow that a general and prolonged advance has begun. Prices may go up for a few weeks, possibly a few months. Then there may or may not be a slight reaction downward, probably to be followed by another upward reaction. The long swing downward had to come to an end, despite the views of many buyers that prices could go only one way, and a swing upward would probably have to come to an end also in less time than have some upward swings in the past like, for instance, the one that began in 1904 and had plain sailing for about three years.

Hoops and bands, a minor commodity, had a turn recently, being now well established at 2.25c. Finished steel prices are now quotable as follows: Bars, 1.60c to 1.65c; shapes and plates, 1.60c to 1.75c; blue annealed sheets, 2.50c; black sheets, 3.00c; galvanized sheets $4.00; tin plate $4.75 to $5.25; plain wire 2.60c; galvanized wire, 3.10c; wire nails, $2.90; cement coated nails, $2.45 hoops and bands, 2.25; standard steel pipe, 68½ per cent basing discount.

Mill Operations

In the last week before the sheet advance of $5 a ton became effective the American Sheet & Tin Plate Company (Steel Corporation) had the largest sheet bookings for any week in its en-

tire history. The independents had also had large bookings As a result, while the sheet market is naturally quiet now with the higher prices ruling the sheet industry is operating at about 75 per cent of capacity, its best rate for nearly a year, and the best rate shown for any finishing branch of the steel industry. The various wire mills, also aided by a recent advance which had brought in tonnage at the old prices, are running at 50 to 75 per cent. The pipe mills in most cases are running at 40 to 50 per cent. Tin plate mills are running at 50 to 60 per cent, or at fully double the rate of last July, when there were large stocks of tin plate at mills, also large stocks of various goods packed in tin plate containers.

With percentage rates like these obtaining it is nevertheless the case that steel ingot production is running at only 33 to 35 per cent of capacity. The rate of steel production is held down by the low production of bars, shapes, plates and rails, which count much more from the mere tonnage standpoint than do the lighter lines.

Expectations are that steel production will continue to increase during the next few weeks. Much ground has really been covered already, since ingot production dropped just under 20 per cent at the middle of July, and an increase to 33 per cent is good enough for a trifle over two months. By the end of November the rate should be between 40 and 50 per cent. Unless there are unexpected developments in railroad buying and buying for large construction jobs generally the rate will hardly go above 50 per cent this year, and a little backset in December and January, which are usually dull months in the steel market is to be expected. Then, by early spring, a general and important further revival in steel demand and mill operations is confidently expected.

Pig Iron

Each month Messrs. W. P. Snyder & Company compile average prices of Bessemer and basic pig iron from actual sales of valley iron reported as made in the month in lots of 1000 tons and over. The September averages were $20 for Bessemer and $19.25 for basic. At about the beginning of September there was a general advance in the asking price on basic iron from $19 to $20, but it seems all the sales were made at $19 25, neither at the old price nor at the new asking price.

The Standard Sanitary Manufacturing Company, which has been operating practically full time of late, has brought 15,000 tons of foundry iron for fourth quarter delivery, 5,000 tons for each of its three plants, Louisville, Ky., Pittsburgh, Pa., and New Brighton, Pa. For the Louisville plant southern iron was bought at $19, Birmingham, while for the other two plants valley and Western Pennsylvania iron was taken, chiefly at $21, valley, though it seems a little iron was picked up at a concession The market is now quotable at $20 for Bessmer, $19.25 to $20 for basic and $21 for foundry, f. o. b. valley furnaces, freight to Pittsburgh being $1.96.

POINTS IN WEEK'S MARKETING NOTES

During the past ten days a renewed confidence has made itself felt in the iron and steel market. One large steel merchant reports that if the next two weeks continue to be as good as the ones which have passed, it will be the best months business in over a year.

Very little British steel is being imported. Canadian and American mills seem to be furnishing the trade successfully. Some small rush orders for steel have been shipped to Europe, but such a condition is not expected to last long.

In the Montreal market, second hand tools are more active than new machines. The prices on machine tools have been cut somewhat recently, and it is expected that such machines will move faster in the near future.

Bars, Shapes and Plates are now the center of interest in the matter of prices. The demand for these products, in proportion to the productive capacity, has been much smaller than the demand for lighter products.

The finished steel market seems to have rounded the turning point. Prices are getting on a better basis and some think that prices will go up further in a few months from present date.

Hoops and bands are now well established at $2.25. Bars are quoted at $1.60c to 1.65c; shapes and plates 1.60c to 1.75c, blue annealed sheets 2.50c; black sheets 3.00c; galvanized sheets 4.00c, and tin plate at $4.75 to $5.25.

Boiler tubes are down in price this week. The changes are shown in our quotation sheets.

The sheet industry is now operating at about 75 per cent capacity. This is its best rate in over a year, and the best rate shown for any finishing branch of the steel industry.

TUBES AND DRILLS SHOW DROP IN PRICE

TORONTO, October 6th.—In spite of the fact that no large orders are being closed, one cannot complain regarding general market conditions. Even the dealers themselves admit they have no reason to kick, for all things considered, business is fair. The only point which causes concern is the lack of stability. One week business will pick up in such a way that everybody gets their desk cleared for the general rush, but alas the very next week business has dropped into a rut once more. Judging from the number of enquiries floating around, there is business to be had. Several firms, according to some dealers, must be on their last legs so far as supplies are concerned, and are holding out to the very last minute hoping for a still further drop. As one dealer puts it: "those type of buyers are due for a drop themselves, for they will find, much to their sorrow no doubt, that prices are as low as they possibly can be, taking all productive costs into consideration. When they do come into the market they may be held up for delivery, where by placing the business now they can be assured of receiving their goods within a reasonable length of time."

This holding off policy seems to be existent in practically all trades of the market. Machine tool dealers, perhaps more than any others, feel the brunt of this movement. "We know some firms at the present time who know they require equipment, and who also know we can supply them efficiently, yet refuse to buy, until the very last moment." Another dealer claims that his line of remanufactured machine tools are selling much better than new machines. Second hand tools, which are almost the same thing, are moving at a fair rate of speed. In fact we know of one concern that frankly admits they make more profit out of such sales than they do on new tools. "Our prices on new machines are so low" says this dealer, "that the margin of profit is hardly worth while."

The Steel Market

The steel market continues to show seasonable improvement in many lines. The increased price on sheets of $5 per ton, which was announced last week, is making itself felt in the Toronto market. Some dealers have in turn stiffened their prices to cover this increase, while others again have held off until they see if any further advancement takes place. Speaking on the matter one dealer remarked to Canadian Machinery that although he had not so far advanced his price he intended doing so. "It is my contention" he said "that the moment prices go up at the mills, our's should increase automatically. When prices drop suddenly, customers naturally expect us to drop our prices at once, and we have to doso, so that it is also reasonable to say that we should stiffen our lists just as quickly."

While sheets went up, tubes came down, and these new prices are included in this week's quotation pages. The lap-welded tubes are the ones affected, the reduction varying according to the size of tubing. The reason given for the reduction, is that tubes have been slightly higher in level than they should have been, and this downward movement now brings them to their proper level.

Small Tools

The small tool market also shows some changes this week. Carbon and high speed drills have dropped roughly 10 per cent., these changes being all recorded in this week's quotation list. Business in small tools remains much the same as last week. Plant owners have not got away yet from the hand to mouth policy, so that the orders placed are by no means large. In another portion of the present issue we mention the possibility of a large automotive concern placing a good sized order for small tools. More than likely this business will be scattered around the country, rather than placed with one or two concerns.

When we speak of the scrap metal market, we refer to a very sick party. Not only is the market weak, but there is no present indication that things will improve before the next market letter is written. Nobody seems to take an interest in this section, and buying of scrap is almost unknown. The best thing to do is to leave this market alons, and look to the other sections for encourage- West reports better conditions and say West rep s etter nd t ns and ay that farmers are out to buy. It may seem a large stretch of the imagination from the farmer's purchases to our own market, but indirectly this movement will have its uplifting effect. The movement for a new machinery hall at the Toronto exhibition is still under way, and the various manufacturers have been asked to guarantee the reserving of certain space for the necessary length of time. Once they do this, and go into the cost of such a building in detail, we can expect something definite. So far, the approximate cost has been stated, and we can look for some further development in the near future. We badly need such a building, and it is to be hoped manufacturers will get behind the movement.

IRON AND STEEL MARKET IS ACTIVE DEMAND FOR PIG IRON GETTING BETTER

Special to CANADIAN MACHINERY.

MONTREAL, October 6th—From practically all sources comes the report that, during the last ten days a renewed confidence in the iron and steel markets has appeared. The poor business conditions of the last year, sometimes described as the "buyer's strike," seems to have disappeared. Inquiries for quotations for a variety of lines are coming in with a regularity that seems to convey the unmistakable impression that confidence in the iron and steel market has been restored. Inquiries have resulted in orders in many cases. One large firm of steel merchants state that if the next two weeks continue to be as good as the past two, it will be by far the best month's business they have had in more than a year. The volume of business, however, is only fair, and if judged by standards set up in the last five years, it is only small, yet it is a distinct improvement over business conditions of the last ten or twelve months.

It is hard to assign a reason for this change of conditions, but the change is here nevertheless. Some say that the consumer has realized that prices are at last down to the low level. In many instances iron and steel quotations are practically made at production costs. Stores of materials have been depleted and buying has been of the "hand to mouth" variety and not for store purposes. In a few lines, such as pig iron, prices have increased lately as the demand grew greater. Thus as liquidation in many lines has been completed, stability is being attached to price lists, and no doubt the next change in price of many lines will be an upward revision.

The non-ferrous metals have not responded to the general conditions in as great a measure as the iron and steel trades. Very little British steel is being imported. Canadian and American mills seem to have been furnishing the entire trade. One English firm having a branch office here, states that there have been instances lately where some European rush orders could not be taken care of by British mills and that the steel has been shipped from Canada. This is hardly a condition that will be permanent and in most cases the orders have not been large. It is, however, gratifying to know that we are taking advantage of such opportunities to develop our export trade in steel. Eventually there is little hope of exporting our steel to Europe, but an export trade to other points in the British Empre is possible of development. In summing up the market conditions one seems assured that steel will be much more active in the next few months.

Pig Iron

Pig iron shows no change in price during the past week. The demand has been somewhat better, and it has been interesting to note some comments of consumers on the various merits of machine cast, and sand cast pig. Many producers are now manufacturing the machine cast article and are very successful in disposing of same although they have received many objections from foundrymen. Experiments seem to show that the irons are equally serviceable and it will eventually resolve itself into a problem of the cost of production. The foundries locally are doing only a small business and the recovery here seems to be slower than in other lines.

Machine Tools

The machine tool market has not shown a great deal of improvement, although inquiries seem to be coming in more freely The sale of rebuilt machines, however, appears to have been taking the place of the sale of new machines.Good values along these lines are being offered. Prices naturally are not stable. Recently, machine tool manufacturers have shown a tendency to cut prices, and, as soon as general conditions improve machine tools will start to move. However, the conditions in this line of trade are so dependent upon general commercial conditions that the future is hard to forecast.

Small Tools and Supplies

There is a distinctly better tone to the small tool market. Drills to be used in railway shops are fairly active at present. Other lines are moving in a more encouraging way. Liquidation of the war time supply seems to be gradually becoming a factor of less influence in this business. Price lists are being stabilized and the general impression is that manufacturer and consumer are getting "squared away" for normal conditions.

Non-Ferrous Metals

Very little change in prices in this line have occurred during the past week. The market has been dull. The brass foundries have not come into the market yet and the electrical companies are getting some of their copper from the United States as the present customs arrangement rather favors the consumer purchasing direct as against purchasing from the jobber, who has to pay a higher rate of duty. Canadian mills rolling copper do not seem to have been getting their share of the local business. The mill at Trail, B. C. is closed.

Lead and spelter are quiet, also antimony and aluminum. The foundries not having responded to the general improvement in the same measure as some other branches of the metal business, the scrap metal market is still inactive. From week to week conditions do not alter. Until the foundries become an active factor the scrap metal market is bound to languish.

EQUIPMENT WANTED

W. H. Johnson, who operates a machine shop, at Barrie, Ont., is in the market for a 20 inch drill with an automatic feed to be used for boring cylinders. Mr. Johnson informed Canadian Machinery that a good second-hand machine would do for this purpose, and that he would be glad to receive quotations on same.

"MONEY TALKS"

Time and again it has been proven that Geometric Self-Opening Die Heads and Collapsing Taps effect a saving of fully 50 per cent. over the slow and troublesome methods of producing Screw Threads.

One of the Highest Rated Manufacturing concerns in the United States has an equipment of at least 100 Geometric Die Heads and Collapsing Taps. Two of the Die Heads, they tell us, have been in use about 20 years.

For an estimate, we will say that on one Screw Cutting Job a saving of $10 a day resulted by using a Geometric Screw Cutting Tool. That is putting it very low.

Considering 313 working days a year, gives 6,260 days in the 20 years. Putting the saving at the low mark of $10 a day for each of the two 20-year-old Geometric Die Heads, represents a saving of $125,200 in the 20 years.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

Industrial News

Sault Ste Marie, Ont.—The Espanola mills of the Spanish River Pulp & Paper Co., Limited, which have been closed for the past ten days, have resumed partial operations, one paper machine being put in operation.

St. George, N.B.—The Bonny River Lumber Company's mill, and the Wilson Box Company's mill have resumed work after being closed for six weeks. They employ about 125 hands.

The Town of Barrie has installed a 225 h.p. sterling engine, and a DeLaval Pump of 1,500 gallon capacity as an auxiliary to replace the present steam equipment.

Mr. J. H. Bennett, Light and Power Commissioner for Barrie, says that they will shortly install a 500 gallon DeLaval electrically-driven centrifugal pump to supplement the present electrical equipment. Mr. Bennett states that the substitution of the gas driven centrifugal pump as an auxiliary to replace the steam equipment will effect a saving of approximately $2,000 a year.

Sealed proposals will be received at the office of Mr. W. Thorburn, secretary of the Walkerville School Board, Walkerville, Ontario, until noon Wednesday, October 12, 1921, for furnishing all labor and materials and for the performance of all work required for the construction and completion of a Continuation School for the Town of Walkerville, Ontario, in accorance with plans and specifications already prepared. Copies of plans and specifications may be obtained at the office of the architects upon a deposit of $25.00, which sum will be refunded upon return of plans and specifications in good condition within ten days after contracts are let.

The semi-annual fall meeting of the American Gear Manufacturers Association will be held in the Powers Hotel, Rochester, N. Y., Octoger 13, 14 and 15. Interesting reports will be offered by the various committees on standardization and a strong program has been prepared including "Gear Tooth Wear" by Warner Gear Company, Muncie, Indiana; "Duraluminum as a Material for Worm and Other Gearing" by R. W. Daniles, Bausch Machine Tool Company, Springfield, Mass.; "The Grinding of Gear Teeth and It's Future in the Industry," by J. F. Barr, Secretary, The Gear Grinding Machine Company, Detroit, Michigan; "Tooth Forms" by E. W. Miller Chief Engineer, Fellows Gear Shaper Company, Springfield, Vt.; and "First Hand Impressions of Europe," by E. S. Saltelle, Assistant General Manager of the Tool Steel Gear and Pinion Company, who has recently returned from an extensive trip through Europe studying conditions there.

During the past week the feeling of the dealers, manufacturers, etc. in the Toronto District seems to indicate a marked improvement of outlook generally.

The Custom House returns for the Port of Toronto for September show an increase of entries and shipments of approximately 20% over the previous month. This certainly indicates a substantial increase in general trade, which at the present time is most encouraging.

There has been a general cut in prices of agricultural implements ranging from 15% to 30%. Almost immediately following this announcement comes the most cheering report that Massey-Harris Co. are re-opening the Toronto plants which have been closed for some time. The International Harvester Co. of Hamilton are also reported as taking on more men, while the Cockshutt Plow Wks. expect to gradually reach normal production again at no distant date.

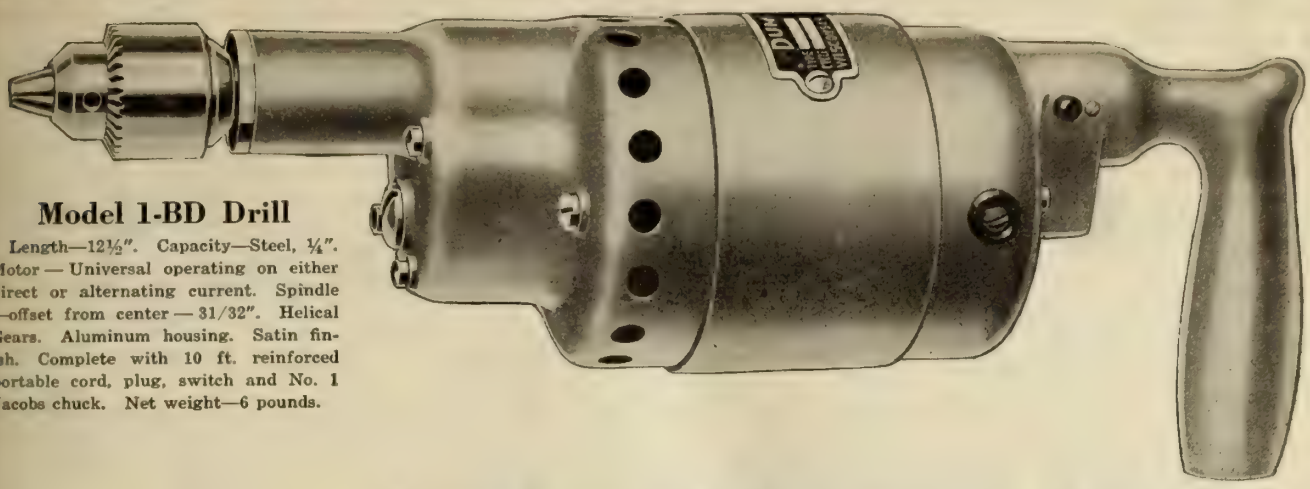
It is reported that the English Electric Co. which recently entered the Canadian field are considering the erection of a large plant in the Ashbridge Bay Industrial district, Toronto. This company is now operating the Crocker-Wheeler plant, St. Catharines.

In Hamilton and district, the general feeling is much more optimistic than it has been for some time past. Many Hamilton plants have announced improvements in trade and are re-opening. In other cases where plants are running short time now they are getting back to full time and taking on more men. The most notable items in this respect are annuoncements that B. Greening Wire Co. are re-opening with complete staff on full time, International Harvester taking on more men and two large textile plants, Zimmerman-Reliance, and Canadian Cottons, going back to full time.

Johnson Bros., 1536 Dundas W., Pattern makers, Toronto, were burnt out completely last week. They have since moved to the factory of the Canadian Rumley Co., 48 Abell St., where they are starting operations at once.

Mr. MacIntyre the owner of the Empire Tool Works, rear 100 King W., has just had two special machines installed for the manufacture and grinding of piston rings. He says these machines work at particularly high speed, and are of late patented design. He also states that there are only two places in the U. S. operating this type at present, and none in Canada other than his own.

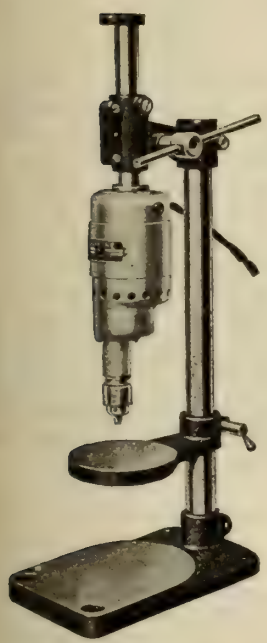
A. G. Milton, 67 Frederick St. machinery dealer says that he had a better month during September for the sale of electrical motors (used) than any other during the year.



Engineering News

IF there is one thing more than another which has contributed to a feeling of confidence among manufacturers during the period of "returning normalcy," it is the number of inquiries that are being received for goods and equipment. While it is a fact that but few of these have developed into actual business, still they are taken to indicate an underlying vitality which must eventually work to the surface.

In Welland, B. J. McCormick, Industrial Commissioner, points out that the large plants which pulsated with business up to the middle of 1920, are now somewhat inactive. Some of them report, however, that, judging from inquiries, they will not long remain dormant. It is reported of one concern that should it land a certain contract on which it has been figuring it will be necessary to extend plant and buildings by 50 per cent.



As previously announced, Welland is adding a barrel factory to her list of industries, while at Dain, two miles to the south, the Frost Fertilizer Co., is planning to locate. At Port Robinson, Hydro Appliances, Limited, will produce washing machines. In and about Welland, therefore, things move steadily onward to the time when the hum of industry will be creating again its wanted enthusiasm.

The Volta Manufacturing Co., Welland, has developed an electric water heater for domestic use. It has stood required tests and is now ready for the market. The water jacket is a solid casting with three chambers, which are heated by two elements fitted into seats in the centre of the jacket. An ordinary thumb button is used to turn the elec-

Rack and pinion feed.
Capacity—Steel, ¼".
Drills to center of 7⅞" piece. Ball Bearing thrust. Aluminum housing. Adjustable table. Complete with 10 ft. reinforced portable cord, switch, plug and No. 1 Jacobs chuck. Net weight 21 pounds.

Handy—Efficient—Powerful

DESIGNED by men who know the practical advantages of small, light tools that get to the spot where needed without waste of time, Dumore Drills save time, money and energy. Equipped with perfectly balanced motors, Dumore Drills are accurately built and have an almost unlimited range of usefulness. For speed and accuracy on fine and sensitive jobs Dumore Drills will supplement the work of your big machines—adding to the capacity of your shop and cutting down production costs on many classes of work.

Send for details of how you can use Dumore Drills to advantage.

DUMORE GEARED ELECTRIC DRILLS

tricity on or off, or there may be thermostatic (atomatic) control, by which the water in the boiler may be kept at constant temperature as required.

Grey iron castings from an electric steel furnace now seem practicable at reasonable cost, according to Mr. Young of the Volta Co., Welland, who has been making experiments in Buffalo. Using cast iron borings, and not too clean at that, castings of fine grain which machine well, have been obtained at a cost of $20 a ton, when similar grades by cupola system run as high as $35 to the ton. The borings cost $5.50 a ton. Mr. Young says it is all a matter of lining and mixture of metal—and the method is quite marketable. It has been almost a matter of conviction that electric grey iron castings were not as machinable as necessary, but this difficulty seems to have been overcome. A grain that is ideal for piston rings or other jobs requiring fine fabric is said to be obtainable.

This has been one of the best years on record for the Pollard Manufacturing Co. Niagara Falls, Ont. They manufacture units for flour mills, and the demand has been increasing, not only in Ontario, but throughout the West. Each unit is a compact piece of equipment, with capacity of 50 barrels a day, by roller process. Many old mills are being dismantled and new machines installed, while in other cases millers of experience have set up independent plants, to serve local or country requirements. In addition to flour mill equipment, the Pollard people marble cutting machinery and are now also marketing a planer of open side design.

One of the busiest plants in Buffalo at the present time, is that of the Buffalo Steel Car Co. This is the result of an arrangement they have entered into with the railways to handle all repairs. Formerly this was done in car shops, which are now practically idle. One object behind the present plan is to secure definite data as to actual cost of such repairs. This is said to have been almost impossible before, or where some reliable information was obtainable the cost was shown to be excessive. It is understood similar plans are being carried out in Canada.

Some improvement is reported in the demand for woodworking machinery, although there is said to be considerable used equipment still in evidence.

A decision on tenders for $50,000 worth of small parts for motor cars, for Canadian Products, Walkerville, is expected early in October.

A public utilities building is being erected in Galt. This will house electric gas, water and other departments of public service. Many men have found employment in Galt this summer on pavement work which has been so long required on two of the more important approaches to the city. Water street pavement is now completed and is now a splendid thoroughfare.

The Semet-Solvay Company may establish a gas and coke oven plant in Hamilton next spring. The proposed unit will cost $3,000,000 and will take over 12 months to construct. The company officials believe that both material and labor costs will be lower next year, and a site in the eastern section of Hamilton is likely to be chosen if this company definitely decides to establish in that city.

Marine News

Work on the raising of the G. G. M. M. steamer Canadian Recruit, which sank near Stone Pillars on August 18 after collision with the steamer Maskinonge, is now progressing rapidly and it is hoped to have the vessel afloat again inside of two weeks, according to officials of the Canadian Government Merchant Marine. Two iron tanks, each approximately 24 feet by 18 feet, are now under construction by Lachance, Limited, of Quebec, who have charge of raising the vessel, and when these are finished they will be taken by barge to where the Recruit lies, then filled with water, one sunk on each side of the steamer and then lashed in place. It is expected that by pumping the water out of the tanks their buoyancy will be sufficient to raise the vessel easily. Mr. J. L. Lachance, is himself superintending the work, which is being rushed, as it is the desire of the firm to have the Recruit raised inside of three weeks, or at least before the cold weather sets in.

Personals

W. D. Ross, one of the directors and vice-president of the Nova Scotia Steel and Coal Co., says that there are evidences of a better demand for steel. Inquiries are more mumerous than for some time, says Mr. Ross, I believe that when the steel business comes back to its own the corporation will be in fine shape to take advantage of the market conditions. At present the rail mill and the wire mill of the Dominion at Sydney are operating, and some work is also being done by the Nova Scotia Steel plant at New Glasglow. In no case, however, are the mills operating to capacity. There has been a considerable improvement in the coal business, the mines of both the companies being busy. A good trade is being done in coal in the St. Lawrence this year.

Hon. Edward Brown, Provincial Treasurer of Manitoba, was in Toronto a few days ago, and amongst other optimistic statements, he said that the business outlook showed much improvement. "The wheat market is very satisfactory this year," he said. "The farmers are selling and there appears to be no disposition to hold. Money is circulating, and the outlook generally is more hopeful."

Obituary

James Edwin Frost, a director of the Frost & Wood Co., and a director and secretary of Smith Fall's Malleable Castings, Ltd., died recently at his home in Smith Falls. Mr. Frost has been in rather poor health lately and had to hand over his active part in the business some time ago.

Alexander Fleck, president of Fleck, Ltd., Vulcan Iron Works, died recently at Ottawa. Mr. Fleck was 54, and early in his career he started a foundry and machine business with his father. Later on he went into partnership with Thomas Stewart, and still later became sole proprietor of the above mentioned company.

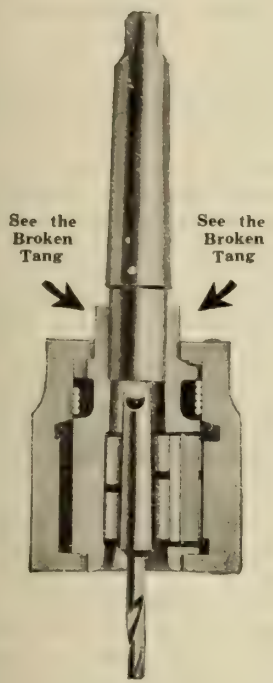
RAILROADS WILL START REPAIR WORK

Will Soon Start Extension Repair Work —Will Purchase Steel for Spring— Co-operation of C.P.R. Will Be Asked

Hon. J. A. Stewart, who has just returned to Ottawa from Montreal, says that he has spent a couple of days in conference with the chief Executives of the Grand Trunk and Canadian National Railways. The unemployment situation in its relation to the National Railways has been thoroughly canvassed, also the possibility of the railways so arranging their repair work and placing new orders so as to obviate, so far as possible serious unemployment during the winter.

Under normal conditions the practice is to place orders for steel rails and accessories in the early spring, but, in view of the existing situation, the department announces that the Government will authorize the Canadian National and Grand Trunk to place their orders in the immediate future.

In addition to repair work now being done in the railway shops, it is the intention of the Government to authorize the management to place orders for rebuilding and repair of freight equipment wherever it is feasible, providing the Department of Labor upon investigation, believes the local conditions may be thereby relieved. The Government will also bring the question of unemployment officially before the C. P. R. management with a view of having it act along similiar lines, and thus assist in steadying the industrial situation The Department of Railways states that it confidently anticipates the co-operation of this concern.



CANADA'S OUTPUT SHOWS DECREASE

Canada's pig iron output for August shows a considerable downward trend. The quantity of pig-iron and ferro-alloys produced during the month of August was nearly 4,000 tons lower than that of July. Pig-iron made by the firms for their own use dropped about 10 per cent., or 5,828 tons, below the previous month's figures. The output of basic iron was considerably higher, being 46,939 tons, as compared with 40,720 tons in July to 1,882 tons in Au-

Aikenhead's

The House That Sells You Quality

The lines of tools sold by Aikenhead's are not only extensive but they are chosen on a "quality first" basis. Keep these points in mind when you make out your next requirements.

The Wahlstrom Chuck

Grips the Entire Shank—Never Slips

If you want an automatic self-centering chuck, a chuck that is mechanically perfect, that never slips, choose the **Wahlstrom.** This quick-acting device is widely preferred because it works just as well with broken tangs as with good ones. The smooth, hardened and ground jaws grip on the **side** of the shank—a method that increases the life of the tools and at the same time reduces costs.

There's no time lost in waste motion with the Wahlstrom Chuck. It is automatic and instantaneous in action. It enables the operator to make tool changes in just two seconds, without stopping the spindle of the machine.

Made in two different styles. One style holds No. 1, 2 and 3 Morse Taper Shank Tools—with or without a tang. The other style is made in three sizes, which hold all sizes of straight shank tools from 1-4 to 1 inch.

Sent on ten days' trial.

Johansson

The World's Standard of Accurate Gauging

Johansson Gauges combine the advantages of both line and end measures. Like line measures they give all sizes within their range—like end measures they are convenient, solid, non-adjustable blocks of steel. The "Limit System" introduced by a set of Johansson Gauges to your shop will assure equal results on all work, even in the hands of unskilled operators.

Johansson Gauges save time, decrease costs and increase both the quantity and quality of the work. Made in twenty-one sizes, giving all dimensions from 0" to 12". They are readily set and sealed to any dimension within their great range.

Write, wire or call at

Aikenhead Hardware, Limited

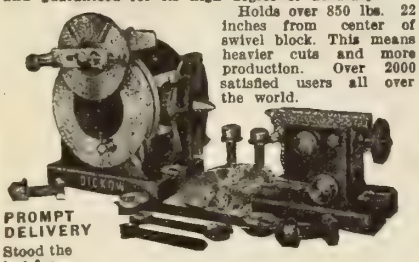
gust. This decrease was entirely in that which was made for the use of the producing firms.

The Algoma Steel Corporation reported only two blast furances in operation at the end of the month, one having been blown out during the period. This loss leaves a total of five furnaces operating and fifteen idle at the end of August. The blast furnaces active were as follows: Two at Sault Ste. Marie, one at Hamilton and two at Sydney.



Steel Ingots and Castings

This month's production of steel ingots and castings, totalling 72,023 long tons, is the highest since November, 1920, being nearly ten thousand tons more than the amount produced in June, the previous record month of this year. The output of steel ingots showed an increase of 25 per cent., or 17,698 tons, over that of last month. Basic open-hearth steel accounted for the increase, this month's total being 70,088 tons, as compared with 52,111 tons in July, all of which was made by the producing firms for further use in their own plants. There was a falling-off in the output of electric steel ingots, 246 tons being produced in August, as against 523 tons in July.

The steel record production of steel during the current month raises the average monthly production from 50,000 tons to nearly 53,000 tons. The average for the first four months of the present year was 45,000 tons, while that for May, June, July and August is 25 per cent, higher or 60,000 tons.

Why Reduce Your Production

and waste money by using cheap, inaccurate Index Centers, when a few dollars more will buy a DICKOW INDEX CENTER, which is absolutely dependable, and guaranteed for its high degree of accuracy.

Holds over 850 lbs. 22 inches from center of swivel block. This means heavier cuts and more production. Over 2000 satisfied users all over the world.

PROMPT DELIVERY
Stood the test for 14 years.

"Maple Leaf"
BRAND
Stitched Cotton Duck Belting

"Maple Leaf" brand costs less than leather, rubber and balata; has a positive grip on the pulley and is true running.

Have us send you samples and see just why "Maple Leaf" sets the standard in economy, strength and durability.

Dominion Belting Co. Ltd.
Hamilton, Canada

Quebec Branch: 51 Duluth Bldg., Montreal

OUTPUT OF COAL IS MUCH LOWER

Value of Shipments Much Lower Output of Mines is Given Comparisons by Provinces

The coal output from Canadian mines during the first six months this year declined to 86 per cent of the amount produced during the corresponding period last year. It was however, five per cent in excess of the output for the same period during 1919, according to the Dominion Bureau of Statistics. With the exception of New Brunswick, none of the province showed an output equal to the 1920 record. New Brunswick produced 104 per cent. of its 1920 output and the other provinces follow in the order named: Saskatchewan, 94 per cent.; British Columbia, 91 per cent.; Nova Scotia, 87 per cent.; Alberta 79 per cent.

The total value of coal shipped during the period amounted to $32,882,953, and the average selling price reported ranged from $2.43 a ton for lignite coal from the different coal producing areas in Saskatchewan to $8.53 a ton for anthracite in Alberta. The average for the Dominion was $5.75. Following is the rate and value per province:

Provinces:	Output	Shipm't	Total Value	Aver. Value per ton
Nova Scotia.				
Bituminous—	2,750,319	2,257,261	$14,536,760	$6.44
New Brunswick.				
Bituminous—	69,230	65,768	377,508	5.74
Saskatchewan.				
Lignite—	145,394	136,670	332,108	2.43
Alberta.				
Anthracite—	46,402	10,357	88,419	8.53
Bituminous—	1,261,080	1,172,804	5,711,555	4.87
Lignite—	1,125,312	979,021	4,405,594	4.50
Total for Alberta—	2,432,794	2,162,182	$10,205,568	$4.72
British Columbia.				
Bituminous—	1,385,323	1,094,405	$ 7,431,009	$6.79
Total for Canada—	6,783,060	5,716,285	$32,882,953	$5.75

TRADE IN MACHINE TOOLS HAS INCREASED

Despite a heavy falling off in tonnage of general machinery imports and exports of Great Britain in 1920 and 1921, as compared with 1915, the trade in machine tools has actually increased according to figures compiled by the American Consulate in London, England. Imports of machine tools during the first six months of 1921 says the report, were 10 per cent above the figure for the first six months of 1913, while in exports the corresponding increase was 5% per cent.

Machine tool imports were 3.63 per cent of the tonnage of all machinery imports in 1913; 16.8 per cent, in 1920 6.36 per cent in 1921. Similar figures for exports show 2.47 per cent in 1913 4.95 per cent, in 1920; 4.69 per cent, in 1921. In value, these figures would be slightly increased, due to the fact that machine tools average higher in unit value than the balance of the machinery entering into British imports and exports.

Textile machinery formed the largest 18,007 tons and 4,911 tons respectively Agricultural machinery provided the largest tonnage of imports in 1913 and 1921, with 18,007 tons and 4,911 tons respectively; and, with 4,685 tons in 1921 stood second to machine tools with 7,1[illegible] tons.

According to the Canadian Pulp and Paper Association, the pulp trade is back to the level of 1919. The exports from Canada for the four months of 1921 are far below the 1920 figures.

These figures show a total value of $5,796,155 for 1921 (July) for paper against $6,877,014 for July, 1920. Total value of pulp was $2,870,401, against $9,137,733 for July, 1920. Pulpwood to the value of $995,039 was exported to the United States in July, 1921, compared with a value of $1,545,906 in July, 1920. Returns for four months to July, 1921 of paper, pulp and wood, as compared with the two preceding years, are: 1921 $34,035,576; 1920, $56,555,423; 1919 $30,327,477.

New Catalogues

The Heald Machine Co., Worcester, Mass., have issued a book on "Cylinder Mass.,have issued a book on "Cylinder Grinding," which is very complete. The subject has been covered not only from the stand-point of the advantages in regrinding, together with the proper equipment to use, but problems have also been discussed which are likely to come up with every concern going into this business. The book contains 120 pages, and is worth while as a handy reference alone.

* * *

The Williams Tool Corporation, Brantford, Ont., have published a book entitled "Don't let it happen to you." The book is really written for the man who operates or owns a pipe threading machine, and contains many hints of value. It takes up the care and repair of dies; machine troubles and their remedies, and other important matters.

* * *

The B. F. Sturtevant Co. Hyde Park, Boston, Mass., have sent us their catalogue No. 278 which explains their air conditioning apparatus. The matter is gone into very thoroughly, and the 48 pages are well illustrated throughout.

* * *

The Greenfield Tap and Die Corp., have issued their catalogue No. 46 which takes up almost 400 pages. All their lines of small tools are shown, and the back portion of the book is devoted to several data charts and tables of considerable value.

Book Reviews

The D. Van Norshand Co., 8 Warren St. New York, have published a book on "Elementary Machine Shop practice" James A. Pratt. M. E. the author, has divided the chapters into the following headings:—Bench and bench work; supplies and miscellaneous tools; hardening and tempering, machine adjustments, equipment and general tools. Next comes lathe tools; the lathe back rest; follow rest; compound rest; eccentric turning, etc. Then follow drill press work; shaper work; the slotter; grinder; milling machine; planer; gearing, and machine shop calculations. A machine glossary together with various tables, course outline, etc., closes the book. Taken as a whole this book should interest all those who are anxious to grasp the fundamentals of machine shop practice. The price is $2.50.

* * *

John Wiley and Sons Inc., New York, have issued through their Canadian representatives the Renonf Publishing Co., 5 McGill College Ave., Montreal, a book called "Elements of Mechanism." This is the third edition, and it has been rewritten, enlarged, and reset. Three authors, Peter Schwamb S. B; Allyne L. Merrill S. B., and Walter H. James S. B. are responsible for its contents, and each of these gentlemen hold responsible positions with the Massachusett's Institute of Technology. They have arranged the chapters as follows:—Revolving and oscillating bodies; belts, ropes and chains; transmission of motion by bodies in pure rolling contact; gears and gear teeth; wheels in trains; epicyctic gear trains; inclined plane, wedge, screw, worm and wheel, also cams. Next follows four bar linkage; linkwork; straight line mechanisms, parallel motions; and other various combinations of motion.

The book goes into the various subjects very clearly explaining the various problems and illustrations in detail. It is not a book for a beginner but rather for the student or designer of equipment who has a fairly good mathematical training. Various problems complete the reading matter, and if readers have been following carefully the instructions given previous to these problems, they should be able to solve them easily. The book is 6 by 9 and contains 427 illustrations, and 372 pages. The price is $3.50. Several colleges are at present using this book for study purposes.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

MAY SOON HAVE LARGE CEMENT PLANT

Owen Sound may have a large cement plant. At present the matter is being held up until the Ontario Government decides what it will do regarding the erection of a Government owned plant. For several months there have been rumors that the Government was lkely to choose Owen Sound as the centre of its operations in the manufacture of cement. The City Council of Owen Sound has been making efforts to learn the attitude of the Government, and it appears likely that the Provincial enterprise will not be launched. On the other hand American capitalists are contemplating the erection of such a plant, and in fact this syndicate was considering the proposition a year ago. The purchase of the Sun cement plant on the west side of the harbor was contemplated, and it was proposed to build additions that would make possible a 3,000 to 4,000 barrel production daily.

Since the first move was made by the Government the price of cement has dropped considerably, and it is understood that the excessive cost of entering the business has been another deterrent for the Provincial undertaking.

If definite assurance is forthcoming that a Government enterprise will not be started the privately owned business may still be started. Owen Sound men working on the project with a view to securing outside capital.

How to Plant an Advertising Crop

Until the advent of the Audit Bureau of Circulations, advertisers sowed their business seed in a vast but fallow field. Some of it grew and returned a fair harvest—much of it was cast upon barren ground and was lost. There was no standardized method of determining the fertility of a publication's field. Experimenting was expensive.

The A. B. C. has eliminated the barren spots of circulation. Planting an advertising crop is no longer an experiment. Advertisers **Know** the field through audit reports. They know whether it is fertile ground and sow their seed accordingly.

The Canadian Machinery circulation has been audited by the A. B. C. Advertisements placed in this publication are seeds well sown.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

BREAKING INTO POLITICS

BY "BOB" ROGERS

The Hon. Robert Rogers, admittedly one of Canada's shrewdest politicians, tells in this first of a series of articles which will appear in early issues of MACLEAN'S a number of highly interesting incidents of his early political history; how he secured railway concessions from Sir William Van Horne and Sir John A. Macdonald, by astute diplomacy, before he was twenty-one years of age; how the Hon. John Norquay, "notwithstanding the fact that he weighed more than three hundred pounds, could dance the Red River Jig by the hour"; and how the future Federal Minister of Public Works was defeated in his first election, 1886, by thirteen votes, because some "wicked Liberal" had a conductor delay a train on which a score or so of Mr. Rogers' supporters were scheduled to arrive.

The first of these articles will appear in

OCTOBER 1 MACLEAN'S

This pen and ink sketch of the Hon. Robt. Rogers was made a few weeks ago in Winnipeg, by H. Weston Taylor, the famous illustrator, at a special sitting accorded MACLEAN'S artist by the former Minister of Public Works.

Arsene Lupin Returns

This famous French detective, who ranks in fiction with Gaboriau's Lecocq and Conan Doyle's Sherlock Holmes, has returned to appear in a series of eight stories, from the fertile pen of Maurice Le Blanc. Each story is separate in itself, and is amazingly swiftly-flowing and dramatic in its action.

OTHER BIG FEATURES IN THIS ISSUE:

The Hole in the Wall—by G. K. Chesterton

A piece of masterly short fiction, Number 6 in the series of tales revolving about "The Man Who Knew Too Much."

The Yellow Streak—by Valentine Williams

The second instalment of an amazing murder mystery involving a war millionaire, a fascinating English girl and a young barrister.

The Valley of Gold—by David Howarth

The concluding instalment of the best by all odds all-Canadian serial published this year, an epic of the Qu'Appelle Valley.

Dafoe, Political Pivot—by "Domino"

A biographical sketch which gives a vivid pen-portrait of the Editor of The Manitoba Free Press, who is such a power behind the scenes in Western affairs.

Dean of the Trailsmen—by Charles Christopher Jenkins

The story is here told of Canada's oldest guide, Henry Alfred Braithwaite, who for two-thirds of a century has been a prominent figure in maritime woods life.

Little Theatres of the West—by Mary H. T. Alexander

An interesting account of what several Western districts are doing in connection with the "Little Theatre" movement.

War Brides Eagerly Making Good—by Miriam Green Ellis

Some pathetic and some humorous incidents in the adventures in settling down of brides who return to Canada with khaki'd Canadians.

Cleco Pressure-Seated Air Valves

Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps — Cleco Grooved Hose Nipples and Hose Clamp Tool

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼ inch to 1½-inch.

STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.

CLECO AIR VALVES.

Style R.A. Style P.O. Style A.

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style R.A.—Right Angle Valve, made in sizes ¼ in., ⅜ in., ½ in., and ¾ in.

CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

The Lightening Hose Clamp Tool illustrated applies wire clamps at a cost of 2 cents each.

In stock: Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

Use Annealed Wire No. 14

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.

Bulletins Nos. 46, 48 and 51. mailed on request.

THE MODEL HOSE LINE illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

CLEVELAND PNEUMATIC TOOL CO. OF CANADA, LIMITED

84 Chestnut St., TORONTO, ONT. 337 Craig St. W., MONTREAL, QUE.

How to Test Advertising

THE man who doubts the power of advertising belongs in the same class with the man who refuses to believe that the world is round simply because he can't get off somewhere at a distance and see its roundness for himself.

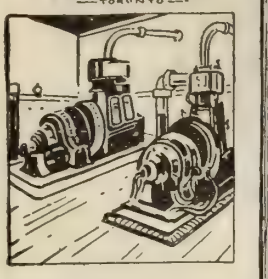
The merchant who fears to attempt advertising because he figures it as an "expense" is blind to his own interests. I personally know several men who, because they once tried advertising to the extent of a cheaply printed hand-bill and didn't find it necessary next morning to call on the police to keep the crowds of eager buyers from swamping their store, loudly and solemnly aver that "advertising doesn't pay."

Advertising *does* pay.

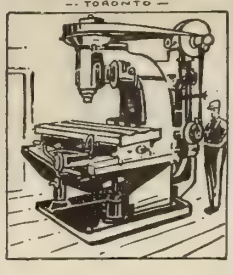
The most successful merchants are the merchants who believe most thoroughly in advertising and who practice their belief.

But advertising, in order to pay, has got to be *intelligent* advertising.

The day of hashed-over superlatives — "best goods," "lowest prices," "best stock in town," "greatest bargains ever heard of," and so on—has passed.



People have learned to distinguish the *truthful* advertiser from the blatant behind-the-times storekeeper who believes that, so long as *he* claims to have the best goods on earth, or under the earth, or within wireless distance of the earth, people will break their necks trying to get to his counters in the forefront of the crowd.



Put some *brains* into your advertising.

Don't let the office boy write your announcements in between his other duties.

Don't doubt the business-getting and business-building power of intelligent and informative publicity — and you will find that advertising *does* pay.

—Jerome P. Fleishman.

For

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working—marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

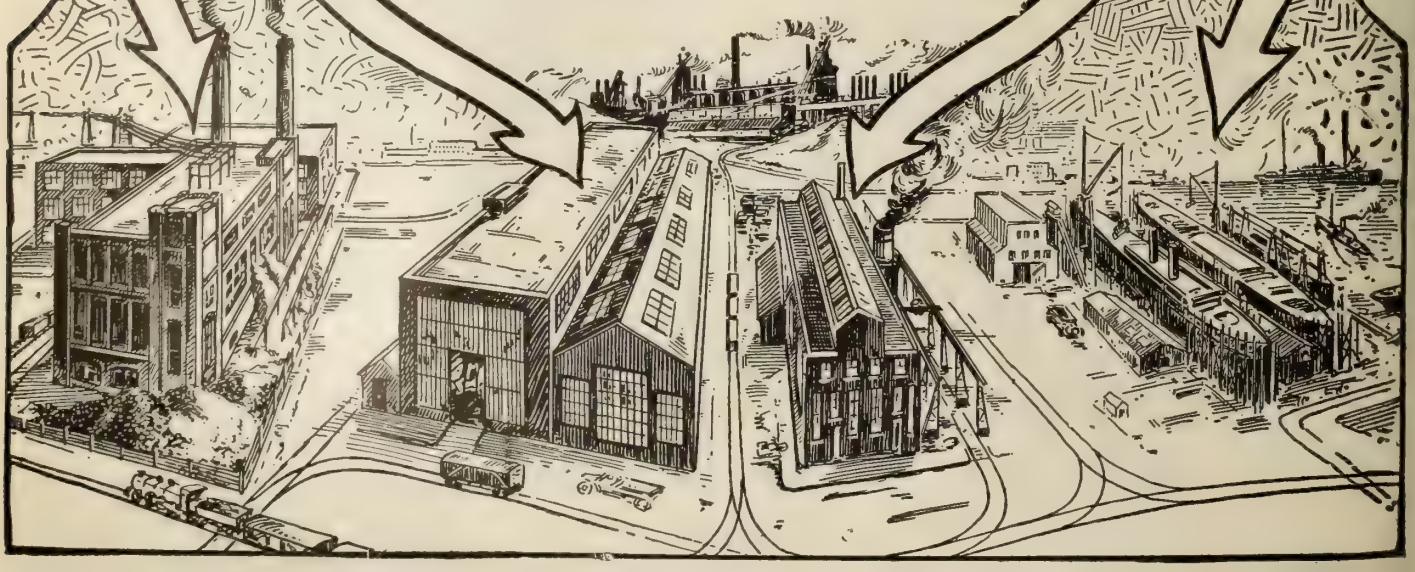
Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)



Published by

THE MACLEAN PUBLISHING CO., LIMITED

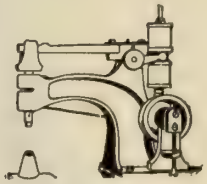
Thirty years' experience and dozens of practical men in your own line, stand ready to serve you. Let them! Subscribe for your paper to-day.



Men with selling problems will find a profitable tip in the statement made by a prominent manufacturer recently, "I use MacLean Publications because I am satisfied that papers with such a high standard of editorial excellence, **MUST** have an influential following."

HIGH SPEED
RIVETING HAMMERS

Speeds Production for the Robbins & Myers Company

The Hammer with the Human Stroke

AN immediate production increase was the result of installing a High Speed Riveting Hammer in the plant of the Robbins & Myers Co., Brantford, Ont.

The work caught by our camera man is Riveting Formed Fan Punching to hub. It demands neatness and speed—to conform to the high standards of this plant.

It takes just half a minute for this work — no comparison with the laborious method of hand sledging. Send us samples or blue-prints and we will quote production figures.

Besides often as much as quadrupling production, High Speed Hammers also better the quality. Hand work cannot approach them for uniformity and fine finish.

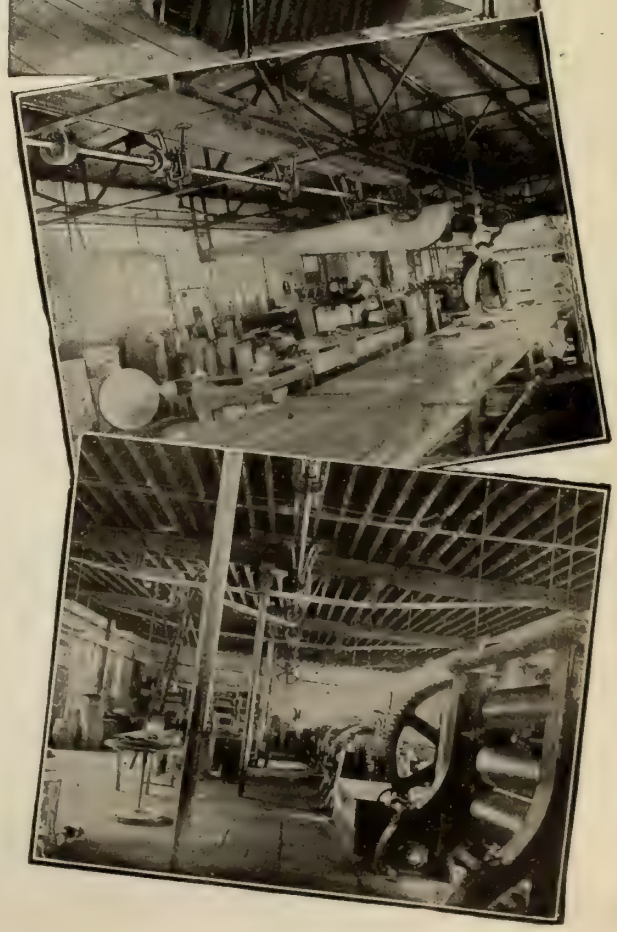
DODGE



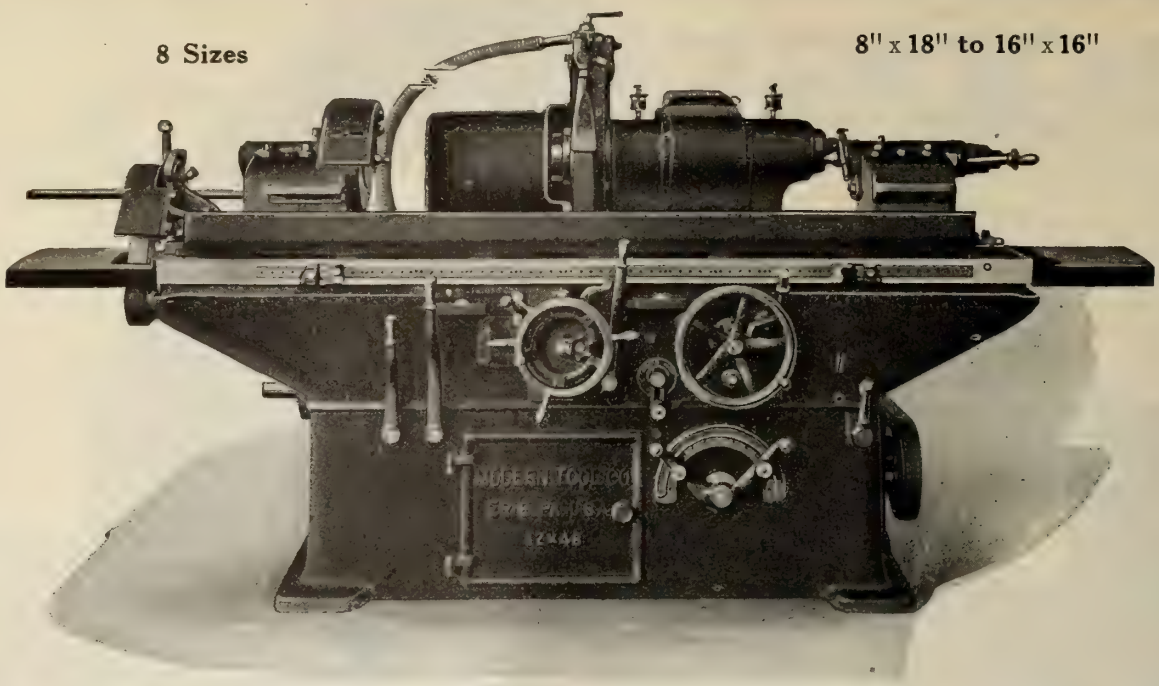
You can always depend on a Dodge Rope Drive

Dodge Rope Drive dependability is not spasmodic. Time-tested in hundreds of plants, Dodge Rope Drives have always stood up to every demand that continued hard service can make.

And service-assurance is not the only reason why a Dodge Rope Drive is the logical prime mover in any shop.

The economy of buying rope by the pound against replacing belt of excessive width is of equal importance—as is also the fact that the rope delivers more nearly 100% of the engine power than does the belt.

However short the center-to-center distance; however complicated the problem of carrying power around corners or from floor to floor, a Dodge Rope Drive may be depended upon fully and continuously to be the simplest and most economical means of accomplishing the desired results.



Dodge Manufacturing Company of Canada, *Ltd.*

Works and Head Office, Toronto, Ontario
Eastern Branch, Montreal, Quebec

8 Sizes

8" x 18" to 16" x 16"

MODERN
Plain Grinding Machines

Main Drive

The shaft is ground, and mounted on anti-friction bearings; runs at constant speed. Power can be applied from a line shaft or direct from motor. All parts are balanced to eliminate vibration.

Wheel Drive

More powerful than other types of same rating. A 4 in. endless belt carries the full power from main shaft direct to wheel spindle, giving constant smooth drive.

Gear Case

All speeds and feeds are secured from one gear box, a separate unit, which may be readily removed for inspection or renewal of bearings. Gears are in mesh at all times, and are engaged with shaft by our patented positive ball drive clutch, which permits instant change. Gears of steel with hardened bushings run in grease.

Send Us

—Blueprints and specifications, and we'll tell you what a Modern will do on your job.

Motor Drive

A constant speed motor may be attached to the main drive shaft of the machine by belt, silent chain, or flexible coupling.

All Modern Plain Grinders are specially designed for most convenient connection to motor.

Table Drive

This is through worm and worm wheel insuring smooth, uniform travel. Four table feeds, 22 in. to 104 in. per minute are secured by lever on front of machine.

Wheel Side

Travel is on "V" and "Flat" ways, giving true, accurate movements and long life. A gib prevents raising of slide when heavy cuts are taken.

Bearings

Wheel spindle has bronze bearings with outside taper. Quick take-up for wear without dismounting is provided.

Main drive has anti-friction bearings.

Headstock has ball bearings.

Gear box has phosphor bronze bearings.

All provided with proper lubrication.

All shafts are ground.

The Time Recorder in the Office

**Stands for Order and Method instead of "Rule of Thumb"—
It is saving time and money in Canada's Largest offices—
Is it at work in yours?**

HOW IT BENEFITS THE EMPLOYER

To the Time-Keeper or Cashier the Time Recorder is an agency for the rapid and errorless registration of working time.

To the Cost Accountant it is an instrument for the rapid compilation of reliable cost data.

To the Management the Time Recorder opens up wider considerations than those attaching to any **ONE** department of specialized work. Accurate Time and Cost keeping are recognized essentials of successful business method but business practices to demonstrate their soundness to-day must pass this additional test: How do they operate upon the lives and personalities of the employees? Do they strengthen those personal qualities which must run parallel with increased efficiency? The Time Recorder, by establishing the principle of fairness and justice in the registering of working time, promotes good will and pleasant personal relationships. It encourages habits of punctuality and carefulness which play so large a part in the development of character.

The staff which has learned to think and work in terms of Time Values has gone a long way on the path to efficiency.

HOW IT BENEFITS THE EMPLOYEE

The punctual employee is glad to have the Time Recorder convey to the management every day the record of his punctuality.

He knows that the mechanically-made printed record cannot be tampered with, neither can it err. He knows that, to obtain recognition of his merits, he is not compelled to parade it noisily; and that when the day comes for promotions, selections are not made by guesswork. He knows that he is protected against favoritism or unfairness. He knows that he is not penalized for the tardiness of a co-employee.

Where is the employee who believes that his own best interests—his hope of stable employment and of advancement would be better safeguarded by haphazard "Rule of Thumb" than by order and method?

Order and Method in office and factory begin with the Time Schedule—the systematizing of working time for the greatest possible efficiency.

The clock is the Supreme Taskmaster in the World's work. Is it not logical that the record of the world's work should be written by the unerring steel hands of the clock itself?

Internationals are adaptable to any line of business. Let us send you particulars.

D.K.McLAREN'S

Genuine British Oak Tanned LEATHER BELTING

Service Shows a Belt's Pedigree

If it's a cheaply made belt—poor leather, slipshod methods—it commences by slipping on the pulley. And it finishes mighty soon too, after that. Wears out and costs you twice as much as it should.

But if it's a good belt, like D. K. McLaren's Leather Belting, you get belt slippage reduced to a minimum plus length of service that makes D. K. McLaren's Belting the cheapest on the market.

D. K. McLaren's Belting is made from only the flawless backs of the hides of choicest steers, oak-tanned by the genuine British Oak Tanning process, which preserves every bit of the hide's natural strength.

Write for list of users.

Oak-Tanning
The most approved process known for preparing belts that last.

It tells me just the facts I need to know.

THE ELLISON CATALOGUE
of Electric Control Gear.

The STANDARD for SIMPLICITY and CORRECT DESIGN

The Ellison Catalogue is a practical text book on Electric Motor Control Gear. It consists of separate lists, each complete in itself, dealing with a particular piece of apparatus and illustrated by photographs and diagrams. The lists give precise information concerning the apparatus with prices and shipping data. Overseas Engineers should lose no time in obtaining a copy of this useful Catalogue.

Also ask for HINTS BOOKLET "C"

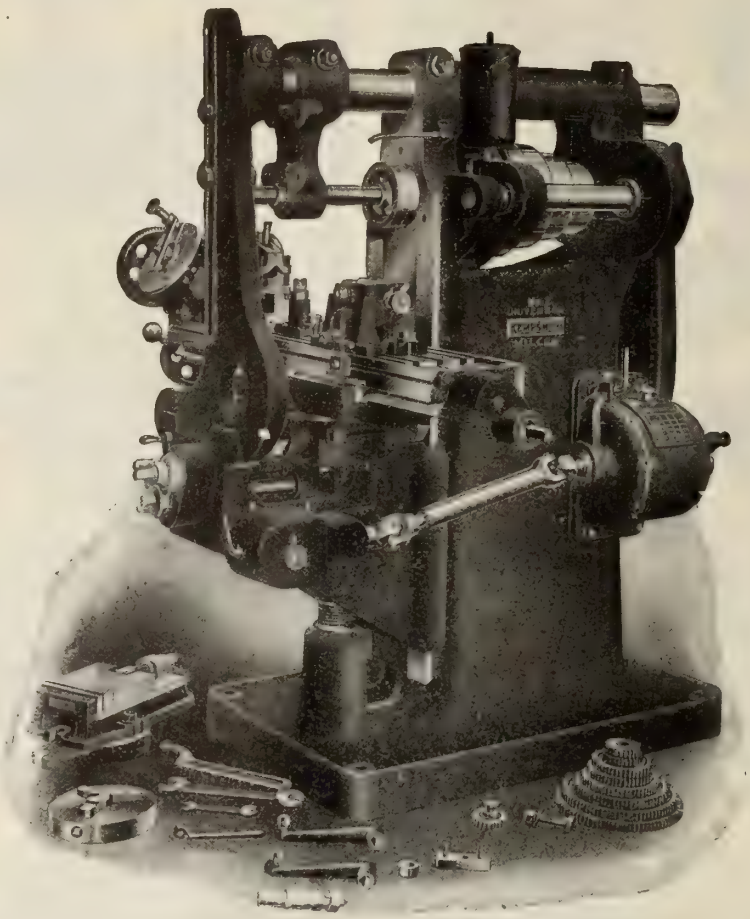
Like Mahomet and the Mountain

It was lots easier to bring Prest-O-Lite and the oxy-acetylene flame to this mammoth wheel than to haul the wheel five miles from a mountain mine to a repair shop.

That's one of the advantages of Prest-O-Lite. Its ready portability makes oxy-acetylene welding possible and everywhere.

And a chain of plants and warehouses assure a constant supply of Prest-O-Lite, the Universal Gas with the Universal Service.



All of which means a Nation-Wide Service which you will be interested in knowing all about.

KEMPSMITH

No. 2 UNIVERSAL

Thirty-two years ago the Kempsmith Company began its career in a small one-storey frame building. To-day there are four main buildings, aggregating 106,000 square feet of floor area, besides various storage sheds, etc. Every building of the plant is a model of its kind.

It has always been, and will continue to be, the purpose of the Kempsmith Company to produce machines of the highest quality only, suited to the most advanced practice.

Every machine, whatever size or type, is put to test under cuts and conditions purposely more severe than it will encounter in even the most progressive shops, and when it leaves our factory it has our positive and definite guarantee back of it.

Literature will be gladly sent upon request.

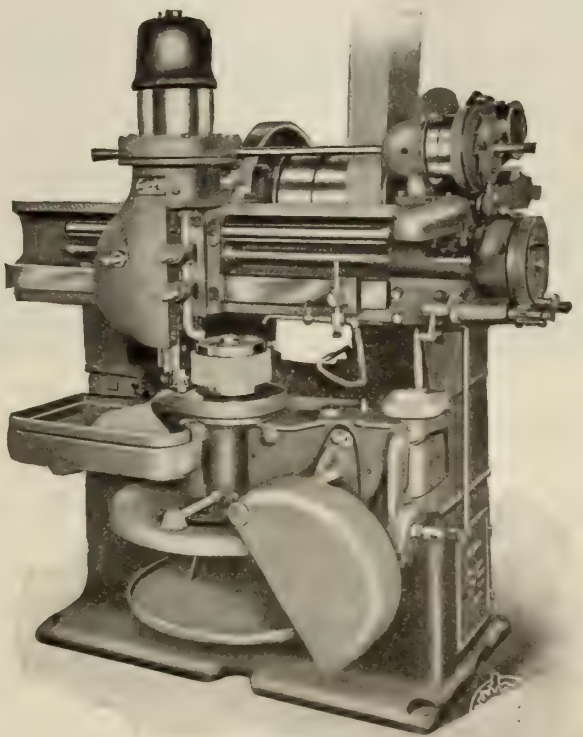
Gear Cutting With the "IFS" Left Out

The Gear Shaper Way



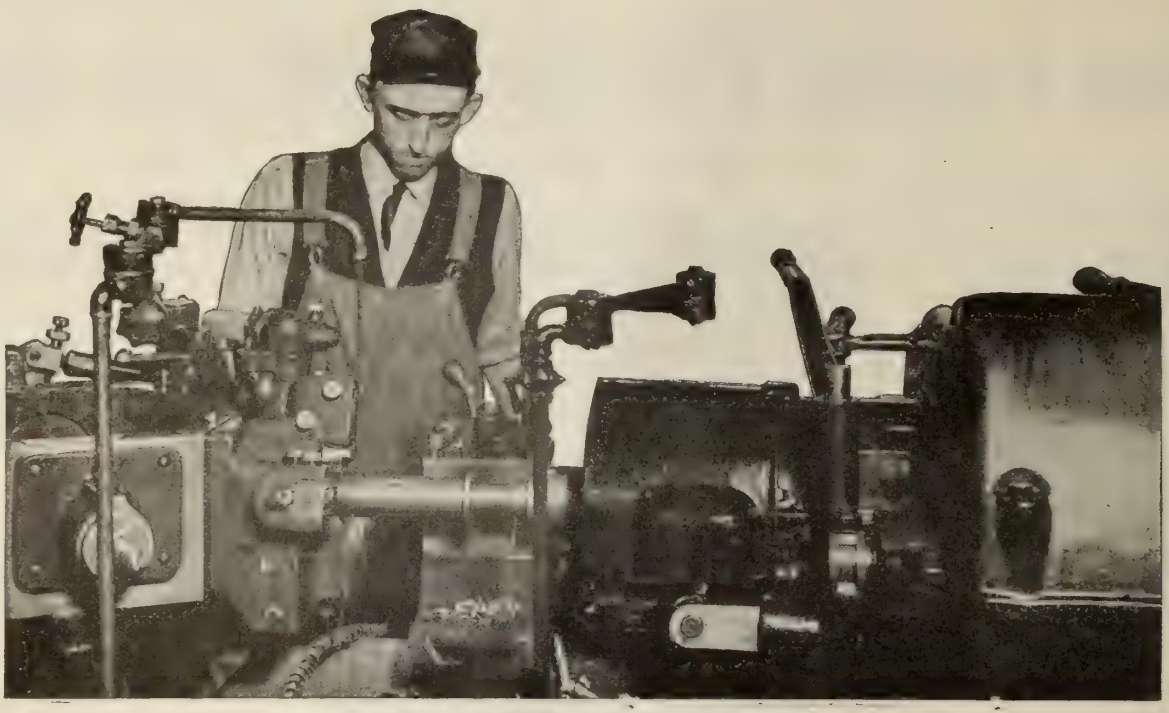
A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this little word "IF."

When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of Gear Cutting with the "IFS" Left Out.

Send for your copy to-day



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting

To Decrease Operating Costs

The side carriage is an important part of the W.& S. turret lathe. It reduces operating costs, often by as much as one-half. It operates simultaneously with the turret and independently of it. The side carriage has a separate feed rod.

Take some of the simplest bar jobs; by cutting off with the side carriage while the turret tools are finishing their work, you save most of the cutting off time.

Here is the picture of a W.& S. 2-A. in a railroad shop. This machine makes bolts, pins, oil cups, valve parts, piston rods, and many other parts used in the repair of locomotives and cars.

On all these parts both turrets operate together.

Take this feature and the fact that the machine operates easily and accurately, and you know why the machine is popular with the shop men. It delivers the goods.

Send us blue prints of your parts and we'll tell you how long it will take to do your work the W.& S. Way.

"Why Don't You Use PHOTOSTAT Prints"

And the PHOTOSTAT makes no mistakes.

It makes photographic facsimiles.

Let us send you a booklet containing letters from many firms telling of large savings through the use of the PHOTOSTAT.

IT is not necessary to carry around large, awkward blue prints for field and shop work. PHOTOSTAT copies can be made either of the blue print or of the original drawing, in a few minutes' time, and at a convenient size so that they will fit into a loose leaf book which is easily handled. Furthermore these copies will not fade or smut and being of uniform size can be conveniently filed for future reference after the job is completed.

The installation of a PHOTOSTAT in an industrial plant means the elimination to a large extent of tracing work, because pencil sketches are copied direct in photographic facsimile; or, if the original sketch is not available the blueprint can be copied equally well. Catalog pages, advertising layouts, maps, production charts, test reports, and documents of all kinds are also copied in photographic facsimile by the PHOTOSTAT with a great saving in time and money.

The PHOTOSTAT is made by the Eastman Kodak Co., exclusively for the

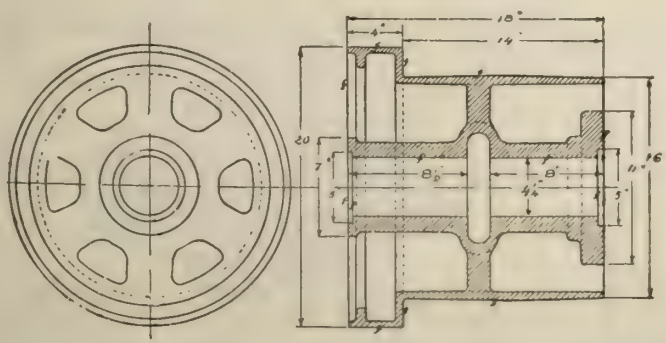
Finishing a 16 Inch Pulley in 60 MINUTES



Speaks Well For "STEINLE" Design and Construction

It is a demonstration of the ability of the Steinle Heavy Duty High Power Turret Lathe to pull maximum cuts at as high cutting speeds as the best tool steel will stand.

Especially is this made apparent when it is realized that the surface machined on each pulley is 1,446 square inches, the surfaces machined including turning the 16-in diameter, turning and facing the 20-in. diameter flange, boring the hub, and counterboring and facing one end of hub. All surfaces received a roughing and finishing cut.

Steinle lathes are built and equipped to handle with equal facility large or small castings or forgings or bar work up to 6¾ in.

Why not send us your blueprints so that we may show what "Steinle Saving" means as applied to your work?

Design-time and Production costs 75% **Metal costs 25%**

You pay 100% for service

. . . and but 25% for the metal that will measure its life

YOU get the service paid for . . . uninterruptedly, or in installments—with repeated renewals or repairs as the metals used stand up to the work.

Economically then, metals used in parts manufacture assume greater value than just 25% of apparatus costs.

Monel Metal, used in power plant apparatus as valve trim, turbine blading, pump rods and liners, etc., where resistance to high heats, erosion and corrosion is vital to service delivery, has more than justified its cost both as raw material and finished product. For the manufacturer by employing Monel has purged his apparatus of weaknesses that compel expensive repairs, costly shut-downs, and repetitive purchases of new machines.

The very toughness of Monel that in some cases will slightly raise manufacturing costs is pledge of its ability to deliver service continuously.

Monel Metal is absolutely untouched by rust, is strong as steel, resists the eating action of most alkalies and acids. Monel retains its strength under high heats that break down the very structure of most metals and successfully withstands the eroding action of high pressure and superheated steam.

The name Monel is given to a line of metal products produced by The International Nickel Company from a natural nickel alloy—67% nickel, 28% copper and 5% other metals. These products include Monel blocks, Monel rods, Monel castings, Monel wire, Monel strip stock, Monel sheets, etc. The name Monel identifies the natural nickel alloy as produced by The International Nickel Company.

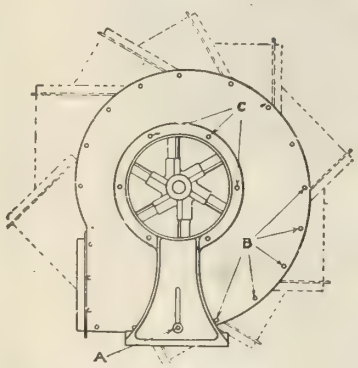
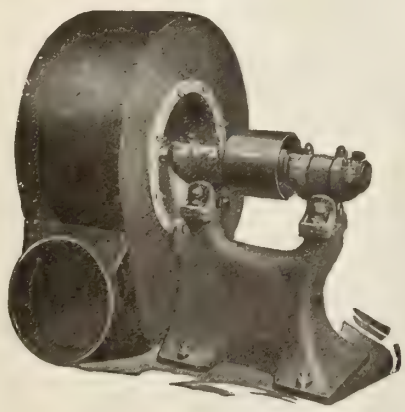
Canadian



The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.



Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons, round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

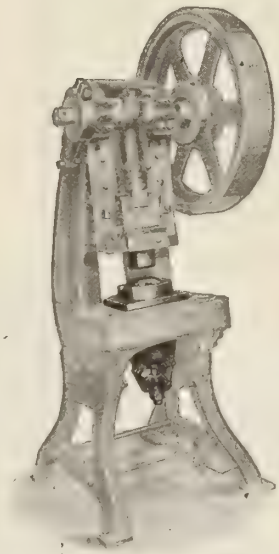
New Bliss Spring Pressure Attachment For Combination Dies



Eliminates Accumulative Spring Pressure.
Reduces Compression and Saves Power.
Insures Uniform Pressure for Entire Draw.
Produces More Uniform Edge. Reduces Breakage.

Patents Pending

The combination spring pressure attachment shown presents to users of combination dies advantages not to be had in those now in general use. It insures uniform drawing pressure on blank during entire draw. The application of the toggle motion giving a uniform pressure reduces total rubber or spring compression materially.

It will be immediately recognized that the strain on the press is reduced and a decided saving in operating power effected. A further power saving is made by the elimination of accumulative spring pressure. The reduction of compression adds considerably to the life of the rubber or spring. The uniform pressure increases efficiency by giving a more uniform edge and reducing breakage. Reduced compression allows the economical manufacture with combination dies of shells deeper than heretofore practical. You can do in combination and reducing dies certain work which formerly required double action dies. The attachment does not interfere with the operator and dies can be removed the same as with the old style attachment.

Patents Pending

Regularly built in four sizes for standard Bliss presses. Depth of draw obtainable on the various sizes is as follows:

No. 18 Press 1¼" depth of draw	**No. 19 Press 1½" depth of draw**
No. 20 Press 2" depth of draw	**No. 21 Press 2½" depth of draw**

To obtain maximum draws given, presses must have same stroke and die space as necessary with old style pressure attachment.

While it is possible to draw in one operation a shell of greater depth than with the old style attachment, it should be understood that to get the maximum depth of draw, correct working proportions between diameter and depth of shell must be maintained.

PRICE F. O. B. BROOKLYN, N. Y.

No. 169

OURS IS A COMPREHENSIVE STEEL SERVICE

The selected raw materials are melted in our open hearth and electric furnaces under careful supervision.

We roll the ingots down into blooms and then into billets, slabs and bars, subject to rigid inspection standards.

And we---*anneal---heat treat---cold draw* to our customers' specifications.

All operations in connection with our manufacture are performed in one large plant and all details receive thorough attention.

We also assist steel users in the working and treatment of our steels after they have left our plant.

It is our aim and earnest desire to serve our clients in every way a steel manufacturer can.

UNITED ALLOY STEEL CORPORATION

Canton, Ohio

Buffalo	Cleveland	San Francisco
New York	Detroit	Portland
Syracuse	Indianapolis	Chicago

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

INTERNATIONAL MALLEABLE IRON CO., LIMITED
GUELPH, ONTARIO, CANADA

Malleable and Cast Iron PIPE FITTINGS

Made in Canada and Exported Abroad

IM

A LARGE plant, up-to-date facilities and thoroughly experienced staff place us in a position to offer unequalled quality, price and quick delivery on Malleable and Cast Iron Pipe Fittings; both screwed or flanged, black or galvanized. All sizes from ⅛ inch up.

We make a specialty of exporting our products and can furnish designs required in any country, such as the Whitworth or "V" thread in use in England, the Metric Pitch in France, or the W. S. Standard in use in Canada and United States.

We will be glad to answer your enquiries.

International Malleable Iron Co.

GUELPH, ONTARIO, CANADA

NOT TOO LOOSE, NOT TOO TIGHT

JUST RIGHT

"Just right" is the only kind of accuracy that's acceptable on these Auto Wheel Bearing Adjusters threaded 5 in. diameter and 16 pitch U.S.

It's not difficult to get threads just right with NAMCO Dies because they are easy to adjust and when set, they can be depended upon to stay right.

One reason for this is their simplicity—there are so few parts. And another reason is the precision of their parts and the way they are put together. Then too, the chasers are just right in lead, fit and temper. That's important.

Little or big diameters, fine or coarse pitches, there's a NAMCO Die that's "just right" for your work. Find out.

STAYBOLT TAPS

The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper, "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

Examine your Files carefully each day for signs of wear.

The proper time to discard a file is when the teeth have become just a tiny bit "dull".

The slightest loss of keenness means reduced efficiency—and a trifling sum buys a new one.

Our famous five brands of files, specially hardened, stay keen and efficient for the longest possible time.

They are:

STAFF

HEPBURN STEAM PUMPS

The right type for high or low pressures.

Long Efficiency
because
SELF-DRAINING
LONG STROKES
ACCESSIBLE VALVES
and
other features insure constant operation and freedom from repairs.

In this Hepburn Patent Feed Pump, the steam chest is located on the side of the cylinder and the low ports automatically drain away all condensation. This prevents water hammer, insures a perfect cushion for the piston, and greatly lengthens the pump's life. If you want Pumps or Vertical Engines, Compressors, Winches, Cut Gears, Derricks, Cranes Etc., see us. Full particulars on request.

JOHN T. HEPBURN LIMITED
Engineers and Iron Founders

Three Generations of Experience

In the Hanna organization you will find not only an intimacy with the best modern practice in the selection and use of pig iron, but also that practical, first-hand knowledge of past methods which makes the soundest basis for the thorough understanding of modern developments.

For three generations the Hanna organization has been an important factor in the progress of the iron and steel industry.

The 6 in. blast gate furnished by you has proven entirely satisfactory. It is answering the purpose of an 8 in. gate valve, which would cost several times as much as a blast gate.

THE BAUR CARBONIC COMPANY
(Signed) Oscar Baur, Pres.

NEW AIR-TIGHT BLAST GATE
Light, Strong, Compact, Inexpensive, Quick-Acting

You have the same opportunity to save practically two-thirds of what you now pay for gate valves.

Low in first cost and upkeep, easily and quickly operated, affording the full area of the pipe—these and other advantages make our New Air-Tight Blast Gate an ideal substitute for heavy, cumbersome, expensive and slow-acting gate valves.

This new Air-Tight Blast Gate is made in sizes from 2 in. to 16 in. threaded and flanged. Descriptive circular 210-T gives detail dimensions of all sizes. Write for copy to Canadian branch.

There's a Message in the Signs of Coming Winter!

"Give a Thought to Your ROOFING"

Safeguard your equipment with roofs and walls made waterproof and fireproof with durable roofing and asbestos sheathing.

JEWEL ROOFING

Here is a quality of roofing that represents one of the best values on the market. It comes in 1, 2 and 3-ply, guaranteed respectively for 3, 5 and 8 years. The low price we are asking merits investigation.

English Millboard

We can supply this finest quality English Millboard in three thicknesses—3-16", ¼" and 5-16". We have a large stock on hand and will be pleased to send samples and quote prices.

EXCELLO ROOFING

Roofs last longer and are free from repairs when they are protected by Excello Roofing. This durable roofing comes in 1, 2 and 3-ply and is guaranteed for 5, 10 and 15 years. Place your orders at once!

Asbestos Fibre (Liquid) Cement

—a rubber-like adhesive and tough preparation made from finest asbestos fibre, creosote and durable oils. Makes any roof no matter in what condition, absolutely proof against climatic conditions. Easily applied over any kind of roof; metal, gravel, paper or composition.

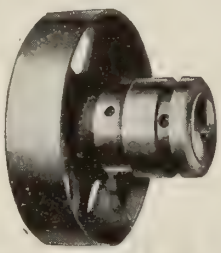
THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building." and our Yellow Catalog.

Good Lubrication Demands Efficient Oil Storage

No matter how good the oil you buy, you cannot have correct lubrication unless it is stored and handled properly. Gritty oil means added friction on machinery parts, with a resultant rapid depreciation.

Bowser oil batteries will show *you* the way to efficient, economical and safe storage and handling of your oils. The leak-proof Tanks keep out all grit and dirt. The Piston-Type Measuring Pumps deliver the oil quickly and accurately. Bowser takes a minimum of floor space and centralizes your oil storage.

Let us prove what Bowser will do in *your* shop.

For

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working —marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

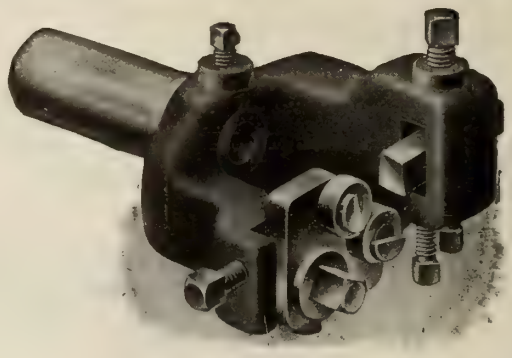
TRADE MARK
BRISTO
REG. U. S. PAT. OFFICE

PATENTED SAFETY SET SCREWS

SET A NEW STANDARD



The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

Ruling Prices on Book Paper 100 Per Cent. Higher than in 1914

In an effort to reduce production costs by getting lower prices on their paper supplies, publishers who are members of the Canadian National Newspapers and Periodicals Association asked for a conference with paper manufacturers. This conference was held in Toronto on Sept. 8, when the situation was fully discussed. Today some publishers are actually paying more for paper than in 1920, while the ruling price on book paper is 100 per cent higher than in 1914. In some cases even more than 100 per cent. increase is being paid. Unfortunately no relief is promised by the paper manufacturers. This does not, of course refer to the grade of paper used by daily newspapers, which is materially lower in price now than in 1920. Publishers of Agricultural, Business, Educational, Religious and Technical Newspapers and Magazines in the United States, all of them in direct competition with Canadian publishers, are today buying their paper at from 25 to 40 per cent. less than the prices paid for paper used in CANADIAN MACHINERY. These U. S. publications are all admitted to Canada free of customs duty.

United States Electric Drills and Grinders

The "BUZ"

For all kinds of general drilling in metal up to 5/16"—name plates, cotter pin holes, oil holes, etc.

The "BUZ" is especially adapted to corner drilling—drills within ¾" of corner. Switch is located in handle; under absolute control at all times. Attaches to any lamp socket, alternating or direct current, 110 or 220 volts. Guaranteed the most powerful electric drill of its weight on the market.

Order a few to-day for trial. Their time and labor saving ability will convince you you need more!

The Proper Selection of Grinding Wheels

Development and Advantages of Modern Artificial Abrasives—Grain and Grade—Manufacturing Processes—Production Grinding—Relation of Work to Grain and Grade

*By P. N. Cooke

THE MODERN grinding wheel should be, if properly designed, an efficient cutting tool. If not properly selected, it will be just as inefficient as a lathe or planer tool incorrectly shaped or composed of material not suited to the particular operation. When there is a new machine job to be performed in the shop, the proper tool to use is the first thing to be considered after the job has been assigned to the machine. First of all it is necessary to decide whether a special alloy steel should be provided, or whether a high carbon steel hardened and tempered tool is sufficient, or whether perhaps a stellite tool is warranted. Then there are other factors to be considered; the shape of the cutting edge, the amount of clearance and the heat treatment to be specified before applying the tool to the work. Today, the grinding wheel manufacturer has practically these same things to consider and generally speaking it should be left to him to supply the correct wheel for the machine and for the work in question.

Development and Advantages of Modern Artificial Abrasives

Not so many years ago artificial abrasives were unknown. Until about forty years ago the only tools in common use for the shaping of metallic objects by grinding or abrading were the grindstone and whetstone derived from natural rock. About 1880 the natural emery and corundum were first employed as cutting agents in a manufactured wheel for grinding. The abrasives after being crushed to small particles and screened to practically uniform sizes were bonded together with pottery mixtures into grinding wheels of any specified diameter and thickness. Grinding wheels of these natural abrasives soon found their way into machine shops for sharpening tools and for other operations, because they had certain distinct advantages over the grindstone. It was found that they could be made more uniformly and that they would cut much quicker and wear much longer than any natural stone that could be found. Emery and corundum contained like any mined material impurities which, of course, varied in different sections of the mine and in different parts of the world, but which detracted from the hardness of the abrasive. It was aluminum oxide in the product which gave it its hard quality and good grades of emery rarely ran higher than 65 per cent of this oxide.

Consequently, to produce an abrasive that was free from these varying substances, it was either necessary to refine the natural product at high expense or to make an abrasive by producing a material synthetically. With the invention of the electric furnace, it became possible to manufacture from soft mineral clay, known as Bauxite, an abrasive ranging from 90 per cent to 97 per cent pure aluminum oxide, and which today is known under a number of trade marks, as Alundum, Aloxide, Borolon, Allowalt and other. The electric furnace has also made it possible to manufacture this abrasive with different physical characteristics. The hardness sharpness and toughness of the product is within the control of the abrasive manufacturer. To satisfy the requirements of a grinding wheel under different operating conditions, the abrasive manufacturer has developed aluminum oxide abrasives of several different tempers, each of which is especially adapted for certain purposes.

Years back, when only natural abrasives were known, one abrasive alone had to satisfy all conditions; and the variation in the natural mineral, as previously stated, made it exceedingly difficult to standardize the grinding wheels to employ for any operation. Modern artificial abrasives have revolutionized the grinding industry and have made it possible to duplicate a satisfactory grinding wheel as needed. The electric furnace has still further contributed to modern grinding practice by the discovery of an entirely different artificial product. A chemical composition of sand and coke, with sawdust and salt, under special electric furnace control, results in a silicon carbide abrasive known commonly by such trade marks as Crystolon, Carborundum, Carbolon, Carbowalt, and so forth. Hence, in addition to the different aluminum oxide abrasives for the manufacturer to use in making grinding wheels, there is this later development for certain classes of work for which it is generally known now that the Aluminum oxide materials are not as well suited.

So far as our present knowledge goes, the tensile strength of a material usually decides whether an aluminum oxide or a silicon carbide abrasive is correct. Recent experiments, however, indicate that there may be other physical properties which exert a strong influence in the determination of the abrasive.

Theoretically each grain in a grinding wheel must be so constructed that when the particular material ground is brought in contact with it, it will cut continuously until it has lost its cutting edge and then immediately fracture, ejecting the worn part and exposing to the work a new cutting edge. It is important today that each individual grain be designed to stand up under the grinding pressure for the longest possible time and yet to remain in the wheel after it has lost its cutting power.

To illustrate this more clearly, two distinctly different operations may be cited. Consider a heavy casting, which has been taken from the foundry and which is "cleaned" by a grinding wheel. The mould leaves small fins and gates on the casting, which must be removed and which modern practice has found to be most economically done by a grinding wheel. The man doing the work will exert all his body pressure against the casting and in turn the casting against the wheel face, which means that the grit must be extremely tough to withstand that pressure. Otherwise, it would fracture or shatter and wear away without doing any actual cutting. Contrasted to this operation, consider a job in the tool room where a hardened

*Author is Sales Engineer with the Norton Co. of Canada at Hamilton, Ontario.

steel surface must be carefully and accurately ground. It is plain to see that the abrasive in the first case could not compete with one that would have a tendency to break away as fast as the hardened surface dulled the cutting point or edge. Hence, instead of using universally one single natural abrasive, there are now specially designed and constructed materials which in every respect far excel any natural product. Whereas the foregoing is somewhat theoretical and technical, it is given in detail to emphasize the importance of correct abrasive selection for the grinding operation before any other factors are considered.

Manufacturing Processes

After the abrasive has been determined, which is known to satisfy the conditions that will be imposed on it, the next problem is to decide the process by which that abrasive shall be made into the finished wheel. There are four common methods today, vitrified, silicate, elastic or shellac, and rubber.

The vitrified wheel is best known and is the one used for the majority of the work in the shop. It is the wheel known to be best suited for the usual cylindrical grinding, internal grinding, off-hand grinding and snagging, saw sharpening and tool sharpening. The vitrified wheel is the fastest cutting wheel and longest lived wheel for most work. The dimensions of this wheel are limited. When a large 36 x 10 in. for instance, or some similar size is required the silicate method of manufacture is followed. Silicate wheels are usually used where a cool cutting quality is essential. High grades of steel already hardened and tempered are best ground with silicate wheels to insure preservation of the heat treatment. Knife grinding of all kinds and surface grinding, where the contact between the wheel and the work is large, and where excessive heat will be generated, call for the silicate wheel.

Elastic of Shellac process is followed for extremely thin wheels such as 1/16 in. or 1/8 in. Some saw filers prefer this type of wheel to any other. This particular class of work is done by both the vitrified and shellac wheel with excellent results. It is more a question of personal preference as to which type is chosen.. It is known, too, that for some work a finer finish is possible from an elastic wheel than from any other. And if the wheel is specified to grind in a slot or groove to cause side strain and bending, the elastic or possibly rubber wheel should certainly be mounted. As the process implies, such wheels will "yield" slightly to strain. Such is not the case with the vitrified or silicate wheel. Wherever the conditions surrounding a grinding job would be too severe for the hardest elastic wheel that could be made, the rubber process of manufacture should be recommended. Rubber wheels can be made considerably harder than elastic wheels and will at the same time fulfill the other requirements of the elastic wheel.

It may be said that the nature of the operation will for the most part determine the process for manufacturing the wheel.

Grain and Grade

The grain size of a wheel is determined usually by the mesh through which it is passed before it is ready for wheel manufacture. To illustrate, a size 14

grain would be that which has passed through a wire screen with 14 meshes to the lineal inch. The grain size is determined partly by the finish specified by the shop where the wheel is to be used. On precision grinding, where dresser fixtures are provided and the machine, a fairly coarse wheel can be "dressed" to give a fine finish. The dressing tool, probably a diamond, will cut away the points of the grains and leave the effect of a fine wheel. But for general off-hand grinding, the finish required will play a large part in deciding the proper grit. If there is very little metal for the wheel to remove and if it is desired that the surface be as smooth as possible from a grinding wheel, the grain chosen would necessarily be comparatively fine. On the other hand, if there is considerable material for the wheel to grind away and the finish is not of importance, a coarse grit would answer the purpose far better than a finer one.

Grade is used to denote the hardness of a grinding wheel. It actually represents the strength of the bond or the force exercised by the bond to retain the grain in its setting, With most manufacturers the letters of the alphabet are used to designate grade and practically every letter is used in the grinding wheel grade scale. A rather broad statement is sometimes made that for metals a soft wheel should be used on a hard surface and a hard wheel on a soft surface. This is, of course, only general; there are other factors to be considered with the hardness of the metal before the grade can be established. On a soft surface a wheel would retain its cutting qualities longer than on a hardened surface. In other words, a harder wheel, or one where the grit is held more securely, can be used on a soft metal than on a hard metal, other conditions being the same. The ideal wheel is one where the grade is so nearly perfect that practically no dressing is required. The pressure of the work against the wheel face with such a wheel will automatically break down the dulled particles exposing new cutting grit in the wheel. Dressing will then only be necessary to keep the face absolutely true. Wheels that are too hard for the job are often times used because they give long life, but where attention is given to the production from the wheel it is found that too hard a grade is most inefficient because of abrasive waste, but it usually is less costly to use a wheel that is too soft than to use one that is too hard.

Grain and grade must be considered together; and will be partly determined by the contact which the wheel will have with the work, partly by the design of the machine on which the wheel will be mounted, and partly by size, shape and physical characteristics of the substance ground. All of this information should be given in as much detail to the manufacturer as possible, in order that he may apply his experience and pick out what he knows will be best for that work. It is a great help to the wheel manufacturer if the wheel user, when specifying a new size for new work in his shop, will include with his order details such as are prompted by the information sheet, a sample of which is shown in the present article.

It is extremely simple for a man to jot down the details surrounding the particular grinding operation and the details which are suggested on this sheet, if given completely, will furnish the wheel manufacturer all he needs. He will be able to select the proper grade without any question. It will also enable him to comment, should he find that such items as speed of wheel or work are not best for the greatest efficiency from the wheel.

Relation of Machine to Grain and Grade

The machine used is exceptionally important. The wheel manufacturer is usually in close contact with the various machines on the market and from the Maker's name and model number he will be able to picture the machine and select a wheel for it. If he knows the machine is of light construction, he will expect a slight vibration in the wheel and, therefore, will furnish a grade a little harder than for the machine which is of heavier design. Portable machines, such as electric tool post attachments, pneumatically driven grinders and the like, require harder wheels than the machine made for a single purpose.

Relation of Speeds to Grain and Grade.

In cylindrical grinding practice, for instance, it is important to know the work speed. It is generally recommended that a wheel be operated at approximately 5,000 feet per minute on standard machines and where it is impossible to reach this speed, a little harder wheel would be supplied.

For some work, it is known that special speeds work best; and where the speed must be higher or lower than the one recommended, the wheel should be made respectively softer or harder. A wheel running slow will act softer and a wheel running fast will likewise act harder than at the normal speed. These different wheel speeds for different operations have been determined by the manufacturer and should be followed as closely as possible.

Relation of Work to Grain and Grade.

A general description of the parts to be ground, including their shape, size and especially their composition, is essential before the correct wheel can be selected.

Relation of Operation to Grain and Grade.

The method of applying the work to the wheel is equally essential. Such questions as the following should be carefully answered:—

.—What type of wheel is to be used? Where will the contact between the work and wheel be? In other words, what surface of the wheel will do the grinding? This is particularly important in the case of a countersunk wheel or cup type.

2.—How much material must be ground away?

3.—Is the part to be ground in the rough or has it been previously machined or ground?

4.—Do you propose to grind with water or other lubricants or do you propose to grind dry?

1. Selection of the Abrasive

Influential Factors:

A. Physical properties of the material to be ground .....

- Use Aluminum Oxide Wheels for materials of high tensile strength
  - Carbon steels
  - Alloy steels
  - High speed steels
  - Annealed malleable iron
  - Wrought iron
  - Tough bronzes
  - Tungsten, etc.
- Use Silicon Carbide Wheels for materials of low tensile strength
  - Gray iron
  - Chilled iron
  - Brass and bronze
  - Aluminum and copper
  - Marble
  - Granite
  - Pearl
  - Rubber
  - Leather, etc.

2. Selection of the Grit

Influential Factors:

A. Amount of material to be removed..... — Use coarse wheels for fast removal of stock.

B. Finish desired..... — Use fine grain for fine finish, except in machine grinding operations.

C. Physical properties of material to be ground ..... — Use coarse grain for ductile materials and finer grain for hard, dense, or brittle materials.

It should never be feared that too much information will be given to the wheel manufacturer. He is often blamed for shipping wheels that are not found as good as wheels that have been used before and in practically all cases it is found that insufficient information was given when the new wheel was requested.

Non-Production Grinding

In a great many shops there are grinding machines in use of one kind or another where the wheel is not being operated continuously. It will be used only when occasion demands, such as in the machine or forge shops. It is rather difficult in such cases for the foreman to determine whether or not he is using the most efficient wheel on each of his machines. General observation of the wheel must govern the selection on such classes of work; the finished product, the heat that is generated, the life of the wheel and the amount of dressing points. If it is found that a dresser must be used to remove the glaze from the face of the wheel every few minutes, it is safe to say that the wheel is probably too hard or too fine. Similarly, if the dresser is hardly ever found necessary it may be possible that the wheel is a little soft and that there is some waste because of this fact. In many of these cases the grinding wheel manufacturers recommendations are probably as dependable as any source of experiment that could be made. It is usually wise in a case like this to have two or three wheels tried on the same machine under the same conditions and observe the results of each to determine which one is apparently the best. For this kind of work, the user of wheels should be ready to accept suggestions from the wheel manufacturer.

Production Grinding.

In the shop where there are a great many parts of one kind to be ground and where the wheel is in constant use from the beginning to the end of the day doing nothing but one operation on each part, it is extremely simple to determine the most efficient grinding wheel. Usually such parts are ground on a piece work basis or on a tonnage basis, or occasionally on a "metal removed" basis. For a complete test to determine the most economical wheel, it is possible to collect special data and thereby make the figures more convincing. Amount of metal removed per unit of time, labor cost for the same time and shop overhead as well are three factors necessary to allow complete solutions of such problems.

The following figures are taken from actual production reports:

Wheels Used:—Norton Alundum 12 x 1¼ x 1½ — 14—Q and 14—R

Total cost of wheel to customer at time of test..... $4.52

(Wheels can be used to 8 in. in diameter and discarded).

Wheel No. 1—14-Q

During test diameter reduced from 12 in. to 10¼ in., or cost of cubic inches of wheel used, based on total cost of ..... $4.52—$2.21

Time required—1 hr. 12 minutes

Metal Removed—9 lbs. (Actual loss in weight)

Wheel No. 2—14-R

During test wore from 12 in. to 11-9/16 in. diameter, or cost of cubic in. of wheel used based on $4.52—$ .60

Time required—3 hrs.

Metal removed—8¼ lbs. (Actual loss in weight)

Labor cost was 50c. per hour, shop overhead $1.25 per hour per machine Total grinding cost equals wheel cost, plus labor cost, plus shop overhead:

Wheel No.1—14-Q

Wheel Cost	$2.21
Labor Cost	.60
Shop Overhead	1.50
Total cost to remove 9 lbs....	$4.31
Cost to remove 1 lb.	.48

Wheel No. 2—14-R

Wheel Cost	$ .60
Labor Cost	1.50
Shop Overhead	3.75
Total cost to remove 8¼ lbs...	5.85
Cost to remove 1 lb.	.71

The 14-R Norton wheel is one grade harder than the 14-Q. This, of course, shows most strikingly what relative importance the factor of wheel cost, labor cost and overhead each have. The wheel with long life may be far more expensive to operate than the wheel with the short life, as brought out by the above deductions.

It cannot be claimed that grinding is an exact science. The wheel maker cannot determined the correct abrasive, grit and grade to supply and guarantee that it is the most economical wheel by mathematical methods alone. If he has figures similar to those above, taken from

(Continued on page 36)

3. Selection of the Grade (Degree of Hardness)

Influential Factors:

A. Physical properties of the material to be ground	Use hard wheels on soft materials and vice versa.
B. Arc of contact	The shorter the contact, the harder the wheel should be
C. Wheel speed	The higher the wheel speed, the softer the grade should be and vice versa.
D. Work speed	The higher the work speed, the harder the grade should be and vice versa.
E. Condition of Grinding Machine	Machines in poor condition require harder wheels than machines in good condition. Bearings must be kept adjusted. Foundation must be solid. Machine must be of rigid construction
F. Skill of operator	Skilful operator can use softer wheels than unskilled man—softer wheels mean more economical production. Piece-work grinding usually calls for harder wheels than day work.

4. Selection of the Process

Influential Factors:

A. Dimensions of wheel	Wheels subjected to bending strains should be made by elastic or rubber process. Extremely thin abrasive saws must be made by the elastic or rubber process. Wheels over 36" diameter are usually made by the silicate process.
B. Rate of cutting	Use vitrified wheels for most rapid cutting.
C. Finish desired	Use elastic wheels for highest finish, where rapid production is not a factor. Use silicate wheels to replace sandstones on cutlery, etc.

Valuable Hints on the Dismantling of Machinery

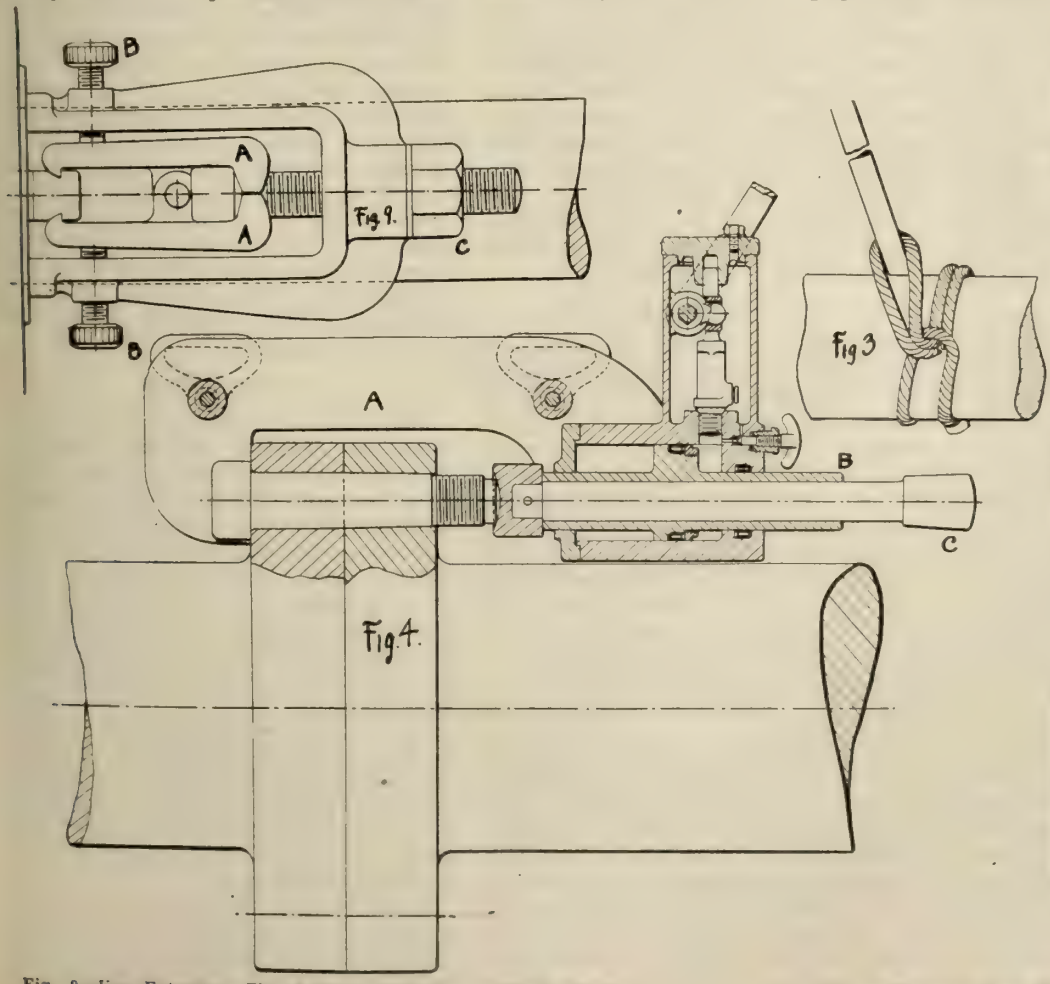
Dismantling is Harder Proposition Sometimes Than Assembling —Separating Rusted Parts—How to Loosen Rusted Bolts and Screws—Seized Parts—Forcing Methods—Specimen of Jack Design—Steady Pull Counts

IN MANY respects it is a much easier task to assemble a machine than to take one apart, especially if the construction is unfamiliar, or the parts have suffered misuse or neglect. The quality of the various fits is unknown, the presence of shoulders, and the handling of threads are often concealed, and damage through pressure and burring add greatly to the difficulty of separation. Of course if one has merely to break up the machine, these problems assume scarcely any importance, but when most of the parts require to be preserved without injury, much care and discretion are necessary. The choice has to be decided between blows or pressure, between twisting or straight pushing, between the application of oil, or of heat. The mind must be quick and the touch sensitive to know when the limit of safety has been reached. And often a decision is forced by the fact that it may be cheaper in the end to cut up or ruin a certain portion in order to get it away, than to waste many hours in a probable futile effort at removing it in good shape. Mostly these points are decided by the monetary question, and the value of the machine. And some pieces are difficult to replace, involving perhaps expensive patterns, or at least core-boxes, or awkward smithing, hardening, or machining.

The relative ease of dismantling is frequently a question of the tools and plant available. Shops that are accustomed to breaking up, or repairs, or re-conditioning of machines naturally buy or make various special appliances for forcing and other operations. This is especially true if the class of plant is fairly uniform. The men soon become accustomed to the best methods of procedure.The work is consequently speeded up, damage and waste are lessened, and the quality of the re-conditioned machine is better. The various difficulties may for convenience be mentioned under specific headings, commencing with the familiar rust problem.

This nearly always presents an awkward case, from the hard grip which the surfaces obtain, and the difficulty of softening or loosening the scales sufficiently without causing damage to one or other of the units, and hence a preliminary loosening has to be sought with the aid of kerosene or gasoline, or an expansive action may be obtained by rapping around the outer element, or warming it up rapidly by a fire, or a white-hot ring slipped over. Any of these devices will ease the fit and pave the way for successful blows or pressure. Oil must be allowed plenty of time to penetrate, and its spread is assisted by rapping with a hammer, while the application of heat also helps the diffusion.

Pressure, though powerful, is not always the best means of separation, because it lacks the disintegrating effect of the hammer. The shock of a blow not only snaps off projecting lumps of rust, and reduces them to less obstructive units, but causes a temporary springing apart of the walls, during which time there is an opportunity for the shaft or pin or other fitting to ad-



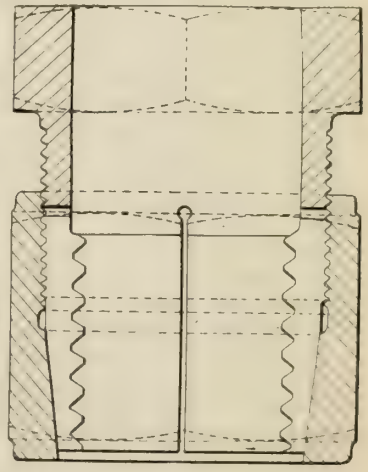


Fig. 9—Key Extractor. Fig. 3—Rope hitch for polished objects.

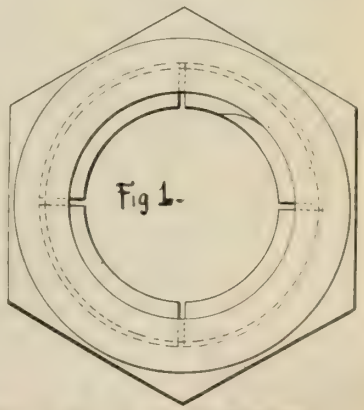

Fig. 4—Hydraulic Bolt Forcer. Fig. 1—A Stud Extractor.

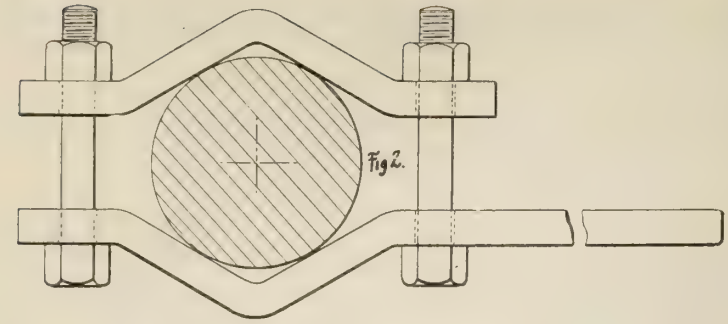

Fig. 2—Grip for Twisting Shafts.

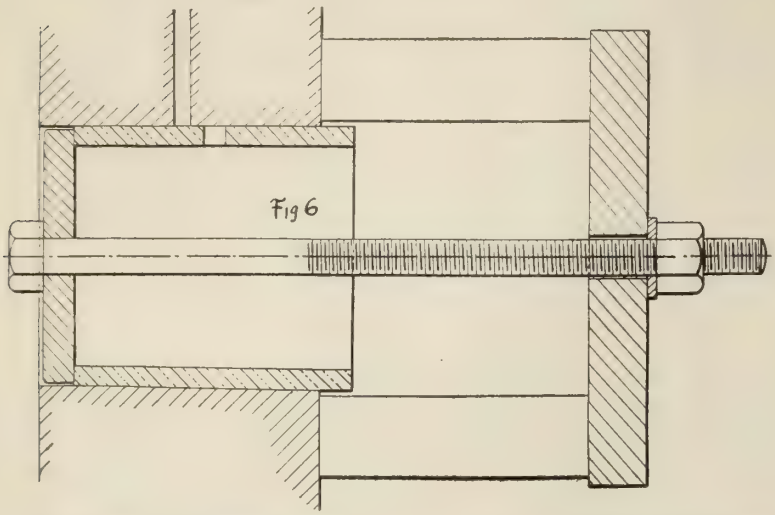

Fig. 6—Method of Extracting a Bush.

vance longitudinally with less trouble or opposition. This kind of useful action is still further assisted by side blows, if the shaft, etc., will stand them without injury, or by blows on the boss or other detail surrounding the shaft. The same remark applies to plane and tongued joints of various sorts which have stuck on the plane surfaces, or become wedged tightly at tongues or shoulders. Discretion has to be used in striking such lateral blows, or parts may be snapped off.

There is also a stage in the operation where direct forcing apart by screw pressure, or by wedges should be tried. It is generally feasible to get a wedge to start in a joint line, following it with another a little distance apart. Then hammering on the face of the piece (at right angles to the direction of driving wedges) serves to shock the rusted faces away from each other, followed by further sending in of the wedges. Both in the wedging and the top hammering, the limit of safety must be carefully considered, and the wedges increased around the edges if those at one side make no impression.

Rusted Bolts and Screws

Plenty of oil is essential in order to get these shifted, but heat is also a useful agent. It can be either applied on the top of a screw, to suddenly expand the head and give the opportunity for turning out (after judicious blows end on), or around a nut to increase the size of the hole. As a rusted screw is not of much value for subsequent use, provided it is of a kind easily replaceable, no time should be wasted in preserving the shape and appearance. A cold chisel struck against one of the corners constitutes a powerful wrench and will loosen the most obstinate nut; and a head may be jarred round very effectually in the same manner. The efficiency is still greater if two men get at the job, striking at opposite corners, which gives a true turning effort without thrust to one side.

Seized Parts

Sometimes the effort to get rusted ojects apart leads to the seizing-up of the metal and increases the trouble considerably. Very often the reason is absence of oil, whereby the abrasion of the metal develops roughness and heat, and tears up the surfaces until they become intermingled. The worst thing to do under these circumstances is to twist the work to and fro, as this aggravates the seizure. Short sharp blows are the most expeditious means of cutting apart the mingled metals, and it is consequently better to drive out a shaft, for instance, than to put a dog or clip on it and twist.

The seizing often occurs by reason of the omission to oil parts when they are forced or screwed together. This is so in the case of stud-bolts, screwed permanently into place, the endeavor to unscrew them eventually being perhaps futile, because it increases the tearing up. The stud may probably have to be twisted or sawn off and the stump drilled out. Where unscrewing is practicable, the well-known stud-block is available provided the fit is not over-tight. If it is, a pair of nuts locked together afford greater turning power. Or an extractor of the split clamp style (as shown in Fig. 1) is quick to tighten and release, and does not damage the stud threads.

It is important when intending to drive out a seized shaft or pin not to go at it in a half-hearted fashion. The blows should go straight in line, and be delivered with a crash. Weak ineffectual hammering only burrs up the end of the shaft, or sets up a peening and bending effect. The portion out of which the shaft is being driven needs to be properly and firmly supported by the boss surrounding the hole, and no risk should be taken of a slip which might allow the rim to receive the force of the blows. As regards the limitation of damage to the shaft end, wood of course is the best thing from this point of view. But a wood block, even though very hard, often proves too yielding to enable a tight shaft to be moved at first. Hence a copper or brass block, or babbitt for less difficult cases has to be selected. If preservation of the shaft centre is important, the lock should be drilled out to clear the hole and prevent the blows from taking any effect there.

Under circumstances that demand a powerful twisting hold on a spindle or shaft, the means of securing the grip may be settled by the presence of a lever or wheel or pulley, but if not, a clip requires to be bolted on. A handy type is the vee-plate, with one arm extended to form a handle, (Fig. 2.) a canvas or copper strip being lapped around the shaft to prevent bruising. When a hold of a milder nature is necessary on a polished shaft or tube, the rope and lever hitch (Fig. 3) answers satisfactorily. The objection is of course that the torque only occurs in the one direction.

Forcing Methods

The risks on excessive hammering, comprising burring, peening, bending, and fracture explain why pressure alone, or in conjunction with a certain amount of hammering is so favored a mode of extraction. The different ways of obtaining pressure include the bench vise, the arbor press, the hydraulic press, and bolt action variously devised. The vise is highly convenient for forcing, within its scope, and needs only a supporting ring or pair of blocks to rest the work against, and a pin to push on the end of the part requiring removal. The arbor press supplies a more generally useful range, because of its extended reach, the capacity for accommodation on the plate, and the quickness of manipulation of the ram.

Hydraulic pressure, either in a fixed or column type of press, or with a portable apparatus, furnishes great power under nice control. The fixed press is

only available under circumstances where parts are of suitable size or shape to bring to it, and its functions are principally concerned with the extraction of bushings, pins, studs, etc. The portable presses are principally applications of an ordinary ram in a special form of frame adapted to suit the contour of the article being treated, but occasionally special cylinders and rams must be devised to fit into awkward locations. An example of this character may be observed in Fig. 4. The press shown is specially intended for forcing tight or rusted bolts out of shaft couplings, such as for propeller and other big diameters. There are two arms, the further one of the pair, A, being seen, locked over projections on the body, and secured by a pair of bolts and distance-pieces, lifting handles being placed on the bolts. This built-up system is handy for getting the machine piecemeal into an awkward shaft tunnel or other confined situation. The ram B is made hollow, for the special purpose of receiving a steel drift C, fitted with a head, against the back of which the ram does the forcing. On working the hand pump as usual the ram moves forward and presses the head against the tail of the bolt. Should the latter be so tight or severely rusted that the pressure will not shift it, blows with a heavy hammer are given on the end of C, driving it through the ram, and starting the bolt while under the heavy pressure (ranging from 20 up to 75 tons, according to the size of the appliance.) A modification of the design serves for forcing drums or barrels from off their shafts, the body being cast into a sort of crosshead, through the centre of which the ram and drift go, while bolts in slots in ears of the crosshead reach out to the end of the drum, and hold a slotted clamp against the boss. Pressure is set up, and the drift struck if necessary.

A specimen of a jack design where the ordinary cylindrical ram cannot be applied occurs in Fig. 5. This is a propeller starter and is intended specifically for forcing ships' propellers from their shafts, an operation which is accomplished in most cases with ease, and not a tithe of the time and trouble involved in the old-fashioned wedge method. The construction embodies segmental jointing, to get the appliance around the shaft behind the propellers boss. Usually four segments are bolted together, but two or three of them can be set around smaller shaft diameters. Each segment constitutes an independent cylinder, of hammered steel, and fitted with a curvilinear ram (lettered A in the illustration) forced against the propeller boss by the water sent by a hand-worked pump through connection B. The backs of the cylinders rest against the stern tube and the three looped pipes provide communication between the cylinders, and allow elasticity to compensate for the altered settings of the segments on different shaft sizes. The stop-cap or plug C can be used on any of the nipples of the cylinders. The size of starter shown is 300-tons, but more powerful sizes are also made.

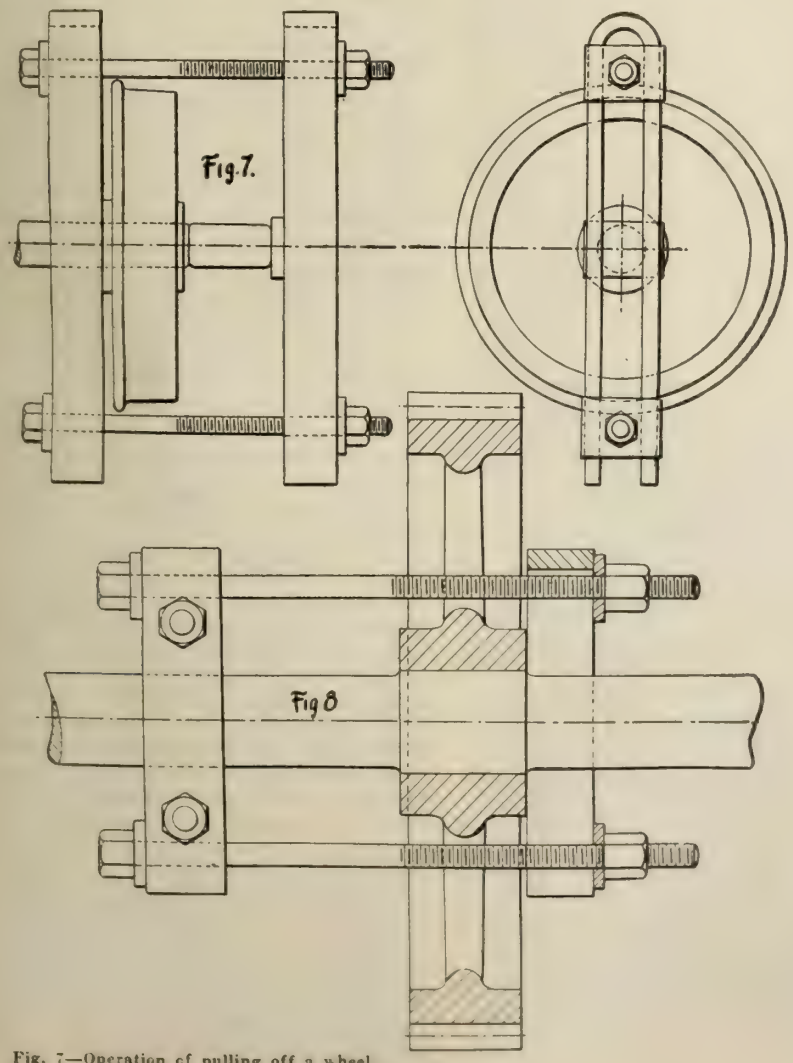

Fig. 7—Operation of pulling off a wheel.
Fig. 8—Pulling a wheel from a long shaft.

Bolt Action

This offers a cheap and accommodating mode of removing all kinds of fitting, the pressure being arranged in various ways with the aid of washers or clamps. One of the simplest cases consists of bushing extraction. This is not easy of accomplishment by hammering because of the narrow end surface and springy clinging nature of the bush, and a steady pressure is more effective and less damaging. An arrangement is represented in Fig. 6, which gives a central pull, and even pressure all over the end of the bush. When a wheel is to be drawn off a shaft, the resistance should be taken against the hub, which necessitates a hair-pin kind of clamp or bar, Fig. 7, to lap round the shaft, with a duplicate clamp at the outside which receives a plate pressing against the short pin used to force the shaft. On certain occasions a wheel or pulley might be located at a distance along a shaft, rendering the set-up shown out of the question. Then, instead of gaining a pressure on the shaft end, a divided clamp is attached at a suitable spot on the shaft, and another clamp passed around the shaft forces against the wheel boss, after the style of Fig. 8. For firms who do a good deal of wheel pulling, the familiar wheel-pullers with central screw and pivoted hook arms are useful.

By the time that a machine needs dismantling, it may happen that the keys are fairly loose and easily got out. But on the other hand, they may have been driven in very hard as a last effort to make them hold, and be consequently burred out of shape, with possible rusting as an added difficulty. On account of the small area of a key end, and the spreading that occurs when hard blows are struck there is generally a difficulty with the usual key drift sent in from the back of the wheel. The employment of a wedge or hooked lever between the head and the front of the wheel is likewise doubtful, the head being pulled out of shape and torn before a start can be effected. The quick-procedure, when such is practical, lies in driving or forcing back the wheel from the key. There is no bother with burring, and the effectiveness of the

blows or pressure much exceeds anything that can be applied to the small area of the key.

The utilization of an extractive device often simplifies removal by substituting a steady pull for battering. Fig. 9 shows a plan view of a tool of this character. It has a U-shaped frame, the feet of which rest against the wheel hub, and the arch receiving a pulling screw. Around the head of this screw fit the tails of the hinged jaws A, A, the prongs of which are formed with inturned hooks to engage in grooves chipped on the sides of the key ahead. These jaws are pressed in firmly by turning the screws B, B, and the key is steadily pulled out of its seat by turning nut C.

Some pieces which are very stubborn must be sacrificed, and separated in any fashion that is easiest and quickest. Here the value of drilling comes in, since it is easy to run a drill in carefully to remove the bulk of the metal, such as a pin, a key, or screw, etc., leaving a mere sheli that can be pryed out with a chisel or pointed bar. The drilling sometimes follows a cutting-off process, such as the shearing of a head, or sawing away of a shaft. It is also feasible in certain instances to drill out a core, and then pass a hack-saw through and make one or two cuts out to the bore of the hole, thereby weakening the shell so that it can be got out with facility. Accuracy of drilling is important if the hole has to be preserved, and a sort of jig-plate comes in useful for such cases. A piece of iron is drilled with a hole of the required size, and it is firmly clamped or bolted over the locality, with the hole in the exact spot to locate the drill and keep it true. By such means straying is prevented, and the hole comes precisely where it should.

Drilling as a preliminary operation to the twisting out of a broken screw offers an advantage for such a purpose, because it may start to turn the screw out unexpectedly. Failing this occurrence, a drift or extractor with square or spiral twisted corners has to be utilised.

When handling brittle or weak objects the drilling method has perhaps to be adopted because any blows are not permissable, as in trying to remove a pin from cast lugs. If it has rusted in, the requisite amount of hammering cannot be allowed, or the lugs will break off. Consequently the pin has to be scrapped, being got away by drilling it out. Even twisting, without blows at all, is not always safe, especially should there happen to be flaws in the casting.

A state of affairs, though somewhat rare arises when one cannot see for certainty the precise spot where a joint occurs, owing to the presence of rust, or of many scratches and lines on the area concerned. If blows fail to afford any indication of the joint line, flooding over with kerosene will sometimes provide the information, the joint showing as a darker line. And if jarring or rapping be done a little agitation of the oil will show at the joint.

SAVING OIL AND MONEY

THE H. H. Franklin Mfg. Co., were having altogether too heavy bills for oil, so proceeded to install an oil salvaging dept. According to Factory, who tells the story, the first problem was to get the oil soaked chips out of the way of the workers. The second problem was to recover from the chips the greatest possible portion of the cutting oil so as to salvage the valuable part of it for repetated use. The third problem was to store the chips and sell them as scrap.

In the equipment now installed, gravity chutes are used in moving the chips from the machine-shop floors, and power methods have been adopted for handling the chips while cleaning them.

The chips are pitchforked from under the machines to barrows which are wheeled to a hopper on each floor. These hoppers protrude into the room from a vertical chute set into the wall like a chimney, and are closed enough to the floor so that the barrows are easily discharged into them. When not in use the hopper swings shut to coincide with the wall, and so is entirely out of the way.

The chips from all floors pass down through the chute, which delivers them to the basement. From this point a trough extends along the wall of the basement to hold the chips. Above the trough a trolley track, equipped with a hoist, is attached to the ceiling. The hoist is supplied with a hook which lifts the inner basin of a centrifugal oil extractor. There is only one extractor, but there are three removable inner basins used in it. One basin is being filled from the chip trough by a helper while another basin is being whirled inside the extractor by the operator. The extractor is driven at high-speed—it is not the centrifugal laundry type, but one especially built for this heavy and high-speed work. The outside of the removabde basin is equipped with protruding radial blades, like a turbine, and steam fed into the circumference of the extractor by a turbine nozzle drives the basin as a rotor.

At the same time the excess velocity energy which still remains in the steam after it leaves the blades of the turbine creates a suction which helps the centrifugal force to abstract the oil through the perforations in the side of the inner basin. The steam also heats the chips and the oil, and forms a semi-solvent, causing the oil to be completely separated from the heated chips, so that it flies out easily through the perforations. The exhaust steam passes out near the top of the extractor, and the oil through a delivery pipe from the bottom.

After the chips are whirled for a sufficient length of time to be completely clean, the operator stops the extractor, brings the trolley hoist, over it and lifts out the inner basin with its dried chips. The trolley hoist, which can run beyond the extractor to a big bin for dried chips, takes the basin to the bin and dumps the chips into it. Thus, two men, with the occasional relief of another helper, are sufficient to clean all the chips.

The chips remain in the extractor long enough to allow the helper to fill the new basin at the chip trough, and also have time enough left over to help the machine operator and helper shove the basin full of dried chips aside a few feet along the trolley track until the extractor is closed and is in operation again.

Then the helper has still time enough left to push the dried chips over to the bin, dump them, and bring back the empty basin to be refilled at the chip trough. Usually two basins are enough to keep the system working. A third basin is used to take up slack by being filled and set aside for use whenever the cycle is interrupted.

The clean chips from the bin are sold periodically in carload lots. They are loaded by gravity directly from the bin into cars.

This company finds that the use of a steam-heated centrifugal chip separator in place of the old-type extractor, which was not heated, is the secret of the great saving which they have been able to show in the operation of their oil-reclaiming system. Where with the old type of extractors they were saving only from three to five barrels of oil each day, with the new installation they are reclaiming approximately twelve barrels each day on the same production.

Roughly speaking, the plant, even if extracting only a half-barrel of oil each day, would pay for itself; and installing a steam-heated turbine extractor would be warranted, as the additional oil obtained would very quickly pay for the expense of the installation.

FIREPROOF SHOES

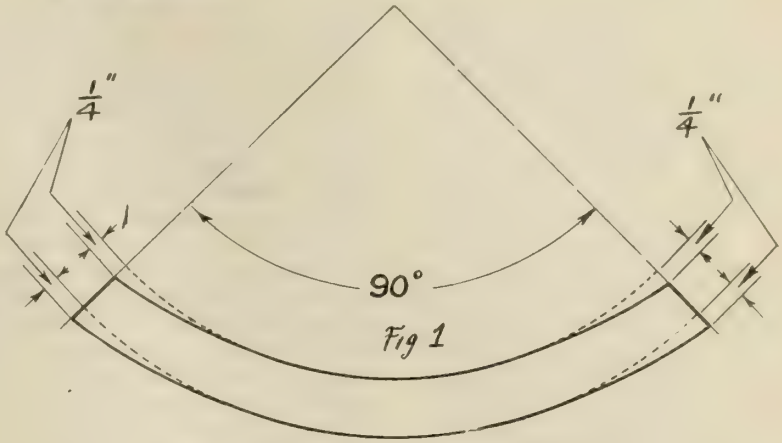
A recently invented asbestos shoe is said to afford protection for those who work in steel mills or foundries, where molten or red hot metals are a constant source of danger. This shoe, it is claimed will protect the feet thoroughly, wear indefinitely and may be quickly kicked off in case of emergency. The uppers are made of the same material as the fireproof curtains used in theatres, and are soft and pliable. The lining is of cotton or canton flannel, both of which materials act as non-conductors of heat, while the soles and heels are of the same material as brake-band lining on automobiles. The shoe slips on like a slipper, having neither laces nor clasps to catch and retain molten metal, and has been found more practicable than any leather shoe.

Making and Boring Out a Huge Stator Ring

This Ring is One of the Largest in the World—Special Boring Mill Built for Extra Large Work—Dimensions of Machine—Method of Making Casting—How Work is Gauged.

J. A. MacGillivray

PRACTICALLY all the light and power energy consumed in the larger Canadian cities is supplied by hydro-electric power. The horse power now developed runs into the millions. In the large cities the demand for this power is very great. Where such a large demand exists it is always economical to install generating units of large capacity. These facts are generally known to even the poorly informed and are common property to the mechanic or man who is ot a practical turn of mind. But few of the men who follow engineering practices, realize the size of some of these Canadian units. The accompanying cut shows the stator ring of one of the largest generator in the world being bored out on the largest boring mill in America—and this is being done in Canada, by Canadians. The work is being accomplished on a boring mill, built especially for the Dominion Engineering Works, Lachine, P. Q. by the Wm. Sellers & Co, Inc. Philadelphia, Pa. There is another mill in the United States that will swing the same diameter, but it will not swing as high work under the cross rail. The table of this boring mill is 20 ft. in diameter and it swings 35 feet between the standards. The frame of the mill is rigidly bolted to its foundation and is not of the extension type, where increased capacity is obtained by moving the frame back on its ways. A general description of the huge machine will not be attempted at present but will appear in a later issue. Only a few interesting facts will be mentioned in passing. The mill is driven by its own electric motors, and will handle work 18 ft. high under the cross rail. The cross rail is clamped to the frame by hydraulic pressure which is controlled by the operator from a convenient position on the floor. This feature does away with the necessity of a man losing time by climbing on the machine to reach the cross rail studs. The huge stator ring shown is 30 ft. 4 in. in diameter, over all. It is of grey iron, cast in four pieces, each piece weighing about 23,000 pounds, making a total weight of 92,000 pounds. The inside diameter is bored out to 27 ft. The castings were swept up, no pattern being made. In sweeping, the sweep was adjusted so that the quarter circle section was flattened out as shown in Fig. 1. The mould was opened about ¼ in. on each end. The cores on the inside of the casting were broken up as soon as it was possible, as it was thought by the foundrymen that if these cores were allowed to remain untouched until the casting was cold the result would be distortion. A cross section of the ring is shown in Fig. 2. On each end ½ additional length was left to be faced off. This work was done on a large facing, boring, and drilling machine. A milling cutter was used, with inserted teeth. When all four pieces were faced, the holes at each end for the bolts that hold the huge ring together were laid off and drilled in two of the four pieces. Then the ring was assembled, with a drilled sector between each undrilled sector. The ring was clamped together and the holes in the undrilled sectors were marked off, later being drilled.



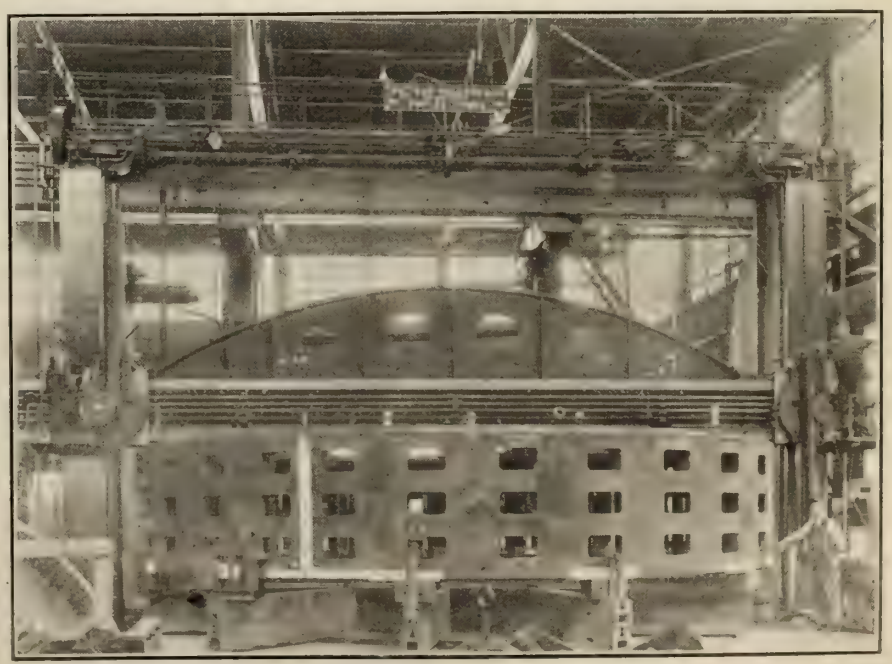


Fig. 2.—Showing Quarter Section Flattened Out.

When the stator ring was finally assembled two things attracted the attention of the writer. First, was that the faced joints were perfect, and second that the castings when trammed was within ⅛ in. of being a perfect circle. Great credit must be given the men who laid off the joints for facing, and to the foundrymen who produced such excellent castings. Of course, the men claim that the work in connection with this stator ring is very simple and only presents difficulties on account of its great size.

Extension pieces had to be placed on the table as will be noted by referring to the photograph. The ring was blocked up on the machine and the surface "A" was machined. Then the ring was turned over and set up again on a planed surface, when all other surfaces were finished. One good roughing cut in all instances served to clean up the scale. Various feeds were used and a cutting speed of from 35 feet to 45 feet per minute was employed.

Showing the Large Boring Mill in Action.

The Distribution of Manufacturing Expense

Five Methods Are in General Use for Distributing Overhead Expense—Man-Rate—Man-Hour—Material and Labor—Sold Labor—Machine Hour Rate—Methods Explained in Detail.

*By C. HAIGH

THERE are five methods in general use for distributing overhead expenses. These are as follows: man-rate; man-hour; material and labor; sold-hour; and machine-hour rate. The man-rate method is the one in most general use because of its simplicity. To use this method, it is only necessary to find the ratio of total expenses to total labor for a given business, and to apply this ratio to the labor cost of each job. For a factory making one product this method of distributing overhead is quite satisfactory, but where the product itself is varied and the tools used in getting out the product are different for each of the various units produced, this method of distributing overhead is incorrect and misleading as to final results. There is no more justification for considering that one dollar's worth of labor actually applied to the product should always take the same percentage of expense than there is for the assumption that a lathe and a boring mill cost the same, are operated for the same amount, and occupy the same floor space, or that the overhead cost of maintaining benches and assembly floors is the same as the overhead cost of maintaining and operating machinery.

This method of applying overhead also assumes that the highest-paid workman requires the most overhead expense, when actually the lowest-paid man often requires the most supervision, and frequently the machine tools used by the low-priced man are more expensive and require greater expenditures for operation and maintenance than those used by the skilled mechanic, because there is incorporated in the machine which enables lower-grade labor to be used the skill that the high-grade man has in himself. Thus, if a semi-automatic machine is used for making any part, a man who is not an expert mechanic can be employed to run this machine or even several of these machines, but if this special equipment were not used a skilled man would be required to be in constant attendance on a simpler machine. It is obvious in this case that the overhead expense that is incurred in running the automatic machines is much greater in proportion to the wages paid the operator of these automatic machines than is the overhead incurred in running the mechanical equipment required by the skilled mechanic.

It is also true that even if the same wages were paid all men in a manufacturing establishment, it would still be wrong to apply the overhead to each job on the basis of a percentage of labor cost, for we would still have the condition of one man running more machines than another, and of the difference in cost of the machines operated; also that some men would be occupied on jobs such as cleaning castings, checking finished product, painting, etc., which require little mechanical equipment, and therefore do not increase the overhead expense at the same rate as their wages increase the direct labor pay-roll. From the foregoing it would appear that the man-hour-rate method of distributing expenses is a dangerous one in some instances, and will result in a loss of money. There are cases, however, where this method may give results which will be satisfactory from the standpoint of profit, as cited in following:—

*This matter was presented before Convention of American Gear Manufacturers' Association.

Standardized Equipment

In a manufacturing establishment where the mechanical equipment is fairly well standardised. where the product, while varied as to different types, still has the same average types of output, and where these types all require substantially the same machining operations, it will be found that the ratio of profit to total output will come up to expectations when the man-rate method of distributing overhead is used. There is also a factor that must not be overlooked when considering any business, and that is the amount of information which the man or men at the head of it have of that business independent of records, as I have frequently found that when estimating the cost of new work, allowances are made by the owner of a business for a higher expected cost due to special facilities which will be necessary and to the expectation that the bigger machines in the plant will be used on the work. By making such allowances the final price submitted includes some of the factors of expense cost that are not actually subject to proof from any records of overhead expense which would be available if the man-rate method of distributing overhead were in use.

There is however, a question as to how many men who manufacture a wide variety of gears can give the necessary weight to all the expense factors which will increase or decrease the cost of a particular kind of gear, and it is undoubtedly true that many of the manufacturers who are making good profits on their total business are losing money on some particular type of gear because of their lack of knowledge of the operating costs of their machines. Also, that they turn down business on which there may be good profit because their selling price is figured on the basis of the average overhead, which brings the price up higher than the buyer will pay.

Man-Hour Method

The man-hour method of distributing overhead has for its base the number of hours spent on a job instead of the amount of wages paid. This method is subject to the same criticism as the man-rate method in that the assumption is made that the overhead expenses have a fixed ratio to the number of hours of time spent on a job. The advocates of this method point out that certain items of expense do not bear a direct relation to the number of hours worked and include under this head the expenses of the pay-roll and welfare departments, compensation, insurance, and supervision. To a certain extent these items do bear a closer relation to hours worked than to wages paid, but as they represent a small part of the total expense, and as it would be erroneous to distribute the major part of the overhead on this basis, I see no advantage in this method over the man-hour basis. Moreover, it can be pointed out that we do not reduce our pay-roll and supervisory force every time business falls off to such a point where we lay off some of the men, and therefore the cost per man-hour of operating these departments would fluctuate sufficiently to nullify any advantage gained over the man-rate method, particularly where this advantage consists chiefly in compensating for the difference in labor rates by substituting hours worked for wages paid.

The application of overhead on the basis of prime cost (material and labor) does not seem to be in very general use. This method requires that the total expenses of a business be divided by the sum of the direct labor and direct material, and that the ratio or percentage so obtained be applied to the direct material and labor cost of each job turned out. It is manifestly wrong to apply this method to the product of a business that uses various kinds of material, but where the product is all made from iron or steel, this method has some good points, as by taking the material into consideration as well as the labor, we apply more accurately the expense of handling the material in the shop, which, of course varies with the size of the piece handled. In a shop using both copper and iron castings, this method would be worse than the two previous ones, as by adding the value of a copper casting to the labor of machining it, we would get a total figure which would

carry a very high amount of expense; this, when compared with the expense cost applied to an iron casting of identical size requiring about the same amount of labor, would indicate that the expense cost of machining the copper casting was as much higher than that of the iron casting as the difference in the price per pound of copper and iron.

This method has many of the same kind of inherent defects as the man-rate and man-hour methods, as we would still be applying an average expense to jobs instead of an actual cost, the difference between this and the other two systems being only that the material is added to the labor before determining the expense to be applied. Even were this method correct for some kinds of business, the places where it could be applied would be limited in number, and this method could never be applied generally.

The sold-hour plan of distributing expenses provides that the total direct labor wages in a department be divided by the number of hours worked in the same period to get a flat average cost per hour for labor. The time in hours consumed on any job is valued at this flat rate per hour, and the result is called the direct labor cost. The expense is applied on the man-hour method previously mentioned.

This method is not a very general use, and little can be said in its favor. The man-hour method of distributing expenses has been criticised before, and not much need be said regarding the determination of labor costs under this plan, as unless the rates paid workmen were practically uniform, still another error would be included in the final cost by using an average rate per hour for labor. There are other methods of distributing overhead for special kinds of business, but because of their limited application they will not be included here.

Machine Hour Rate

The machine-hour rate method consists of distributing all the manufacturing expenses of an establishment by a charge to each job of the overhead cost of operating the machines and other facilities used on that job. This overhead charge is not an average for the whole plant or department, but is, as nearly as possible, the actual overhead cost of maintaining and operating each of the machines, group of machines, benches, etc., which are found in the plant. By the proper use of this method it is possible to show the difference between the expense cost of a boring mill and a lathe, a gear-cutter and a splining machine, etc.

To install a machine-rate method, the number of feet of productive floor space available for manufacture is first found, eliminating the space used for foremen's offices, stairways, washrooms, stockrooms, etc. The number of square feet so obtained is used as a divisor for determining the cost per squsare foot per year for maintenance, depreciation, taxes, insurance, and other kindred charges applying against the land and building. No expenses are included in this group that are incident to the actual operation of the machines, but only those charges that apply against the empty building ready for manufacture. However, the expense of lighting and heating the building and charges of a similar nature are included. In this way a charge per square foot is obtained which is practically the same charge as the owner of a building would make if he rented it and furnished the light, heat, and water used in the building, except that he would include a profit on his investment.

The factory is next divided into production centres, including in each centre machines of a similar type located together, or individual machines where there are no convenient groups. Different kinds of machines should not be included in one production centre, as this would defeat the object of the system. After the division into production centres has been made, the number of square feet occupied by each centre is determined, including in this area the space required for the material waiting to go on the machines, the space required for the workman, etc., and each centre is charged with a part of the rental of the whole building based upon the area occupied. This division gives the rent per year for each production centre, and in this way the total charges of the building which we have called rental charges would be allocated to various production centres. Thus it will be seen that one part of the expenses is now divided in such a way that these items can be included as one factor in the machine-hour rate.

The Actual Cost

The next step is to determine the actual cost of the expense items incident to the operation and maintenance of each of the production centres. These expenses consist of depreciation of the machinery and equipment, taxes, repairs, small tools, cutting oils, and of other charges which can be definitely allocated to the machines that have been included in one production centre. If a small group of machines, all included in one centre, requires the entire time of one foreman, the wages paid this foreman would be included with the other expenses in arriving at the total cost of operating the centres. The distribution of the power charge can best be made on the basis of the horse-power required by each production centre. In this power charge we would include the expense of running the power plant as well as the shafting, belting, etc.

The expenses under consideration should cover a period long enough to ensure correct results, as well as a period of normal operations, so that the results will represent the hourly cost of operating the production centres in normal times and under normal conditions. The best results are obtained if the expenses for a whole year are used as a basis for the machine hour-rate; and if these expenses are carefully analysed and allocated to the various production centres, the hourly rates first determined will not require much adjustment. In fact, the success or failure of the system depends on the amount of attention given to the division of the expenses at the beginning, as, unless the first rates are approximately correct, the first results obtained from the system will be so disappointing and misleading as to cause a manufacturer to condemn it an ti insist for all time that the plan is no good. In this article we will assume that the expenses analysed cover a period of one year.

Two groups of the annual expenses are now divided among the various production centres, and by adding the rental charges and the charges for operating and maintaining the machines, we have the basis for determining the hourly cost of expense applicable to work on the machine-hour basis. To determine the hourly charge, the total normal hours which each production centre will work per year are estimated; then the amount of the expenses allocated to each production centre is divided by the normal hours this centre should operate, and the result is expense cost per hour.

There still remain a few items of expense which have not been distributed, such as supervision, clerical, and general administrative expenses. These expenses should be totalled, and the total divided by the sum of the normal hours of all the production centres. The result of this is another hourly expense cost which must be added to each machine rate as a supplementary charge.

Attention is called to the fact that the machine-hour rate is based entirely on the assumption that the production centres will work a certain number of hours in a certain time, a year having been used as the basis. It is obvious that no man can predetermine accurately the number of hours any machine in his plant will be occupied, and many people reject the idea of installing this system for that reason alone. However, a close approximation of the normal working time of any machine can be found, either by keeping records or by examining records already available, and if the expenses of operating the machine are based on an approximately correct operating time, we have, by machine-hour rate method, means of showing immediately the financial effect of any variation of the operating time of the machines from the predetermined normal or standard operating time.

Making up Rates

In making up the hourly rates, we assumed that we had a certain amount of expense, say 1,200 dols., to absorb in a certain period, say one year, over one production centre. Let us say that we estimated the normal hours that this centre would be used in the year to be 2,400, or 200 per month. On this basis, the hourly expense cost of operating this

production centre is fifty cents. By adding fifty cents for each hour that a job required the facilities of this production centre, we would expect to absorb all the expenses connected with it. Now, if the jobs passing through this centre in a month required the use of the facilities for only 180 hours, we would see at the end of the month that on this particular centre we had failed to absorb 10 dols. of our expenses. We would have the same information for all other centres, and, therefore, for the whole shop, and would know at the end of the month how much of the manufacturing facilities had not been used or had been used more than we expected, this information being available in terms of both hours and money.

It is not, of course, expected that any manufacturer would absorb all of the difference between the amount of expense actually absorbed and the amount he expected to absorb, and to ensure that all expenses are included in cost, a supplementary charge is made to each job to liquidate the amount of expense that has not actually been absorbed through the machine rates in use. This supplementary rate is a part of this system of expense distribution, and is, in fact, a valuable factor, because we know from the amount we add to the cost to absorb these supplemental charges, how far from normal the plant is running. In fact, one of the great benefits of this system is that the supplementary rate soon shows if machines are idle, because the expenses that would be absorbed by machines having work to do become, when these machines are not in use, a part of the supplementary charges, and the fluctuations in the monthly amounts liquidated by means of this charge show to a great extent the efficiency with which the facilities of the plant are being used. It will be evident that the machine-hour rate method permits of a very close knowledge and control of overhead expenses, and that by this system actual costs of each job can be obtained.

When comparing the way in which expenses are distributed by machine-rate costs with the distribution by means of any other method, it will be seen that, as far as accuracy is concerned, everything is in favor of the machine-rate method. All other methods of absorbing manufacturing expense depend in one way or another on averages, and yet there is no more reason for averaging the expenses over costs of all the work produced than there is for averaging the material items.

LUBRICATING OIL TESTS

According to reports the chemical engineering and agricultural engineering department of the A. and M. College of Texas have started an experiment to determine the properties of asphaltic base and paraffin base lubricating oils in internal combustion engines.

Selection of Carbonizing Compound

H. B. Knowlton

THE selection of a carbonizing compound is no easy task. The best test is long use under commercial conditions. Short tests often lead to erroneous conclusions and yet for obvious reasons the selection must be made based on the results of short tests. The object of this article is to tell some of the things to look for in testing compounds and some of the errors to be avoided.

First: The chemical analysis of the compound tells very little. Bone and leather are rapid carbonizers and yet they contain comparatively little carbonizer. The formula which is given in most text books has been discarded by nearly all of the progressive makers of compounds. As much depends upon how well the compound is made as upon the formula. Second: The breakdown test (running several tests without the addition of any new material) often leads to erroneous conclusions. Compounds are not used this way in actual service. The test should as nearly as possible duplicate the service conditions. In running a test the following points should be considered:—

1. Does the compound produce cases having the proper per cent and distribution of carbon?

2. Are the results uniform? Only a well made compound will produce uniform results. No compound will produce uniform results unless the furnace conditions are uniform. It often happens that lack of uniformity of results is charged to the compound when the real trouble is in the way that the furnace is controlled. Test the uniformity of the furnace while it is heating up, with several couples in different parts of the furnace.

3. Does the compound add anything injurious to the steel? Bone adds phosphorous and leather adds sulphur, both of which make the steel brittle. It is claimed that nitrogenous material and cyanides add nitrogen to the steel, causing surface brittleness.

After deciding these questions, economy must be considered. In figuring the initial cost it must be remembered that compounds are purchased by weight but used by volume; hence the weight per cubic feet must be considered. Compounds vary in weight from 19 to 54 pounds per cubic foot. The speed of carbonizing determines the cost of operation of the furnace with a given compound. The cost of upkeep of the compound depends upon two factors. 1. The amount of new material which must be added after each heat to keep the compound up to the required strength. 2. The amount of new material which must be added to make up for shrinkage. The larger one of these two factors determines the cost of upkeep of the compound. There is a vast difference between the different compounds with respect to both of these factors.

It should also be noted whether the compound remains of uniform composition after use or whether it breaks down into dust of one composition and larger sized granules of a different nature. Have the chemist analyse the compound before and after screening out the dust. The compound which passes all of these tests the best should prove both satisfactory and economical in use, but great care must be taken to make all tests comparative and to make them commercial. Guard against using too few test pieces in the test. Even the best furnaces and the most careful operation will produce results showing a slight variation. The more test pieces that are used the more the experimental error will be eliminated.

MAKING AND BORING OUT A HUGE STATOR RING

(Continued from page 33)

One interesting point is the method of gauging or calipering the size of the bore. A steel pin gauge with hardened inserted ends is used. As shown in Fig. 3 the gauge is supported at two points, each 8 inches from the end and its length is accurately determined by precision measuring apparatus of the company. Thus the sag between supports is taken care of, as the gauge is used exactly under the same circumstances, by which its length is determined and checked.

Another interesting operation on this stator ring is the machining of fifty-six vertical slots in the bars on the inside of the stator ring. Some interesting jigs and tools are being designed by the firm to index and machine these slots. The work will be completed with stator ring in its same setting on the mill. Canadian Machinery will have a full description of these tools in a coming issue.

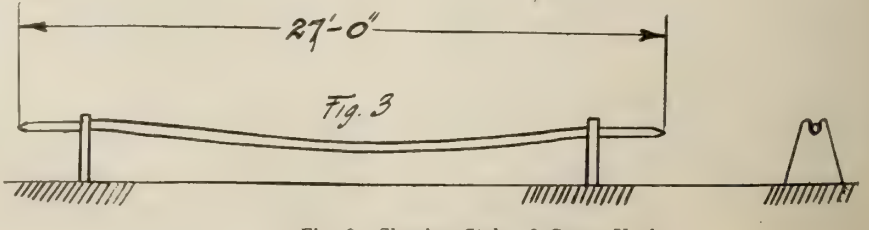

Fig. 3.—Showing Style of Gauge Used.

The Complete Drawing--What Should It Look Like?

What Are the Actual Requirements of a Properly Prepared Drawing?—Items Are Taken Up in Order—Degree of Finish Important—Drawings Should be Protected.

THE TIME-SAVING and error-preventing merits of drawings, made sufficiently complete to yield at a glance all the information required, are rarely fully appreciated by any but the few who have been for years in actual contact with the manufacture of large varieties of mechanical parts.

At a time when standardization is such a common dominant in the minds of manufacturers, continues V. O. S., in "Mechanical World," it is surprising to find, when comparing drawings produced in some of the most progressive drawing-offices of to-day, that rarely can any be found to contain what are, from the works requirements, basic essentials.

Through the lack of modern workshop experience many excellent functional designers and draughtsmen do not know, and often fail to realize when they do, all that is required of a drawing to make it a highly efficient instrument for all who have to use it.

The first essential of a drawing is clearness of outline and figuring. To obtain this, main outlines should be at least 1/32 in. wide; other lines about half this width. Figures should be block vertical with main dimensions 3/16 in. high, and fractions or tolerances 3/32 ins.

The layout, equidistant and balanced with ample spacing.

Arrow heads, terminating dimension lines, should be of ample size, and finish dead on the lines.

The greater the contrast of coloring between the lines and the surrounding ground of a drawing, the more quickly can it be read, and the clearer and more lasting will be the mental impression formed.

The lines should be dead white on a deep-blue ground. This necessitates the employment of a tracing ink sufficiently opaque to withstand a considerable exposure.

Dotted and dot-and-dash lines, often used to show the position of invisible outlines, are a frequent cause of drawings being misread. The possibility of this should be avoided by showing a sufficient number of clear projections.

Sectioning and cross-hatching are also often confusing, and should be replaced by shading the tracing with a light colour-wash to produce a semi-tone. Machine surfaces should be coloured red. By far the safest way to show tolerances is to give both limits; the absence of a tolerance may denote a known limit.

Tolerances should be complete and leave nothing to chance.

Limits for areas, sections, etc., which, if departed from, would affect the efficiency or strength of a machine, should be fixed by the functional designer. This applies to dimension between rough as well as machined surfaces.

Every factor or essential of a part should have fixed limits.

The planning department, who, from the designer's drawings, make the detail working drawings, should see that all limits required are clearly stated.

By doing so they will not only be avoiding the many troubles which follow undefined limits, but they will be effecting a very considerable saving as well by preventing time being wasted on obtaining a greater degree of accuracy than may be required.

Degree of Finish

The exact degree of finish desired on a surface is another important item that, by being stated, will frequently prevent disputes and effect a saving by preventing a needless finish being given to surfaces not requiring it. The simplest way of doing this is to adopt a set of symbols, each representing a different grade, such as: Rough machine, rough grind, finest machine, finest grind, polish, etc. It is only then necessary to place the symbols through the lines representing the surfaces and give the code on some other part of the drawing.

The dimensions, limits, and information given need only be sufficient for the requirements of the department to whom it is issued. They vary with the operation or process. Those required by a blacksmith or a man roughing-out a casting, unless the rule of thumb is preferred, are quite different from what a driller or a grinder requires.

A list of limits to be defined on drawings should be hung up in every drawing-office, and should include the following: All dimensions, angles, and radii; concentricity and the peculiar relation of any faces one with another; compositions, strength, and elasticity of materials; hydraulic and atmospheric test pressure; degree of hardness, Brinell's; depth of casing, etc.

The arrangement of figuring on machine-operation drawings should be in agreement with the procedure of the operations. There is generally a common working face from which operations commence, and it is often the best practice to project all dimensions from this face so that they appear in the sequence required.

On no account should addition or subtraction or any other figuring be required to obtain a dimension. Neatly enclosed in a border round the drawing should be given all information that may be required pertaining to the part represented: The sequence of machine operations, suitable machines or groups, together with fixtures, tools, jigs, and gauges. A list of times required for each operation can also often be included with advantage. Any special processes required, such as heat treatment and case-hardening, dressing, cleaning, etc. If the part is a casting, the pattern number, or, if a stamping, the number of the die.

The order number and symbol number: If these have to be marked on the part, the method of doing so and the desired position should be clearly stated. The location of the part before and after an operation, with its final destination or stock-bin number, is useful in many instances.

Besides its own number and location in the different departments where it will be stored, a drawing should also show direct connecting references to all other drawings and sources of information that may be required. The date of issue from the drawing-office, the draughtsman's and checker's signatures, and the first order for which it is required should always be given. Spaces should be left for modifications, alterations, and their dates, or for any other information it may be found necessary to add from time to time.

For those departments requiring a complete reference of all the particulars of a part, the grouping together of all the small detail drawings on to one large sheet is an ideal method of storing information that can be rapidly visualised.

When ordering parts to be made by other firms from drawings supplied, particular care should be taken to ensure that not only is the drawing correct, but that no information is lacking.

Should Be Protected

Drawings that may have to withstand frequent use should be protected with a coat of varnish. On no account should workmen be allowed to handle drawings; however careful they may be, it is almost impossible for them to avoid soiling them. A boy attached to the drawing exchange of each department should rest or attach them to some special stand or fixture convenient for the workmen to read without need of handling. When finished they should be collected and replaced.

The slightly higher cost of an ideal drawing is invariably exceeded by the saving it effects.

The amount of time wasted in many factories by employees seeking information which is not, but should be, on drawings is very considerable. If a record was kept for a year, the loss shown would be sufficient to cause

(Continued on page 53)

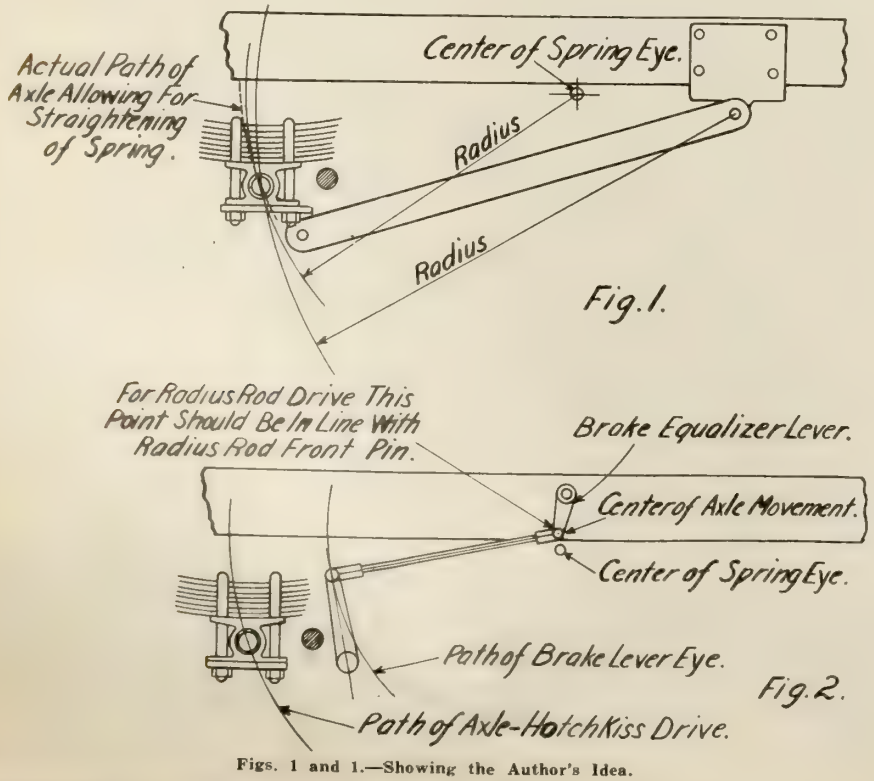
WHAT OUR READERS THINK AND DO

AUTOMOBILE REPAIR WORK

By A. L. MORGAN

The article on "Automobile Repair Work" by Donald A. Hampson, which was published in your Sept. 8 issue, made very interesting reading.

Referring to the section on his radius rod repair job, I would like to point out a few things which may be helpful to him and to others engaged in the same business.



The "Hotchkiss" drive is a very good drive in the opinion of very many experienced automotive engineers, but in the design of some trucks, as appears to have been the case in the one referred to in the above article, something was evidently wrong, or no such trouble would have been experienced with the brakes, if the truck was properly looked after. However, for the present I will not go further into the merits or demerits of the "Hotchkiss" and radius rod drives.

In applying a radius rod to a "Hotchkiss" drive truck it is first of all necessary to put a shackle between the front end of the spring and the spring bracket the same as the one already at the rear end in order to allow the frame free movement in relation to the spring within the limits imposed by the action of the radius rod. If this is not done, the axle, as it moves up and do lation to the frame in going over bumpy roads, or under load, will be trying to move about two centres at the same time, namely, the centre of the spring front pin and the centre of the radius rod front pin.

If arcs of circles (see Fig. 1) are struck form these two points as centres and radii equal to their distances from the centre of the axle it will be noted that these two arcs cross one another. The straightening of the spring as the axle moves upwards further increases the angle at which the arcs cross . It will be plainly seen that a heavy strain is put on both the radius rod and the spring, to say nothing of the parts to which they are connected, by this movement, which will very likely result in a break in one of these parts sooner or later. Also, the bracket for the radius rod is attached to the frame very close to the point of maximum frame stress so that holes drilled there, which have not been provided for in the original design, are apt to cause trouble from this excessive strain.

In either the radius rod, or the "Hotchkiss" drive, in order to have the brakes work properly, the arc described by the axle in its movement in relation to the frame must be concentric with the arc described by the ends of the brake levers about the ends of the equalizer levers. See Fig. 2. If the latter are already located and are not to be changed, this will settle definitely the proper location of the front end of the radius rod and consequently its length.

Another cause of brake trouble in "Hotchkiss" drive trucks is poor connection between the spring and the axle. In fact I think this is the cause in ninety-nine cases out of one hundred. Clips alone are absolutely useless. There must be some positive anchorage that will prevent any movement whatever of the spring on the axle, forward or backward, under any strain within the pushing or pulling power of the spring. There are several well designed anchorages on some of the well known "Hotchkiss" drive trucks. It would be interesting for those repairing them to notice this point.

Figs. 1 and 1.—Showing the Author's Idea.

NEW CATALOGUE.

The Carter Welding Co., Toronto, have published a new book which describes in full the "Rego" line of welding and cutting apparatus. General cutting torches; general welding torches; light welding torches; heavy duty torches; sheet metal welding torches; decarbonizing torches; soldering torches; lead welding torches; various styles of manifolds; regulators of various natures; portable welding outfits; general welding outfits; soldering outfits, and in fact, all sorts of nipples, fittings and wrenches are included in this book which is very neatly arranged.

COLOR VERSUS HARDNESS

Quite often a workman spends considerable time in carefully drawing the temper of a piece of carbon steel, only to find to his dismay that it is soft, while yet the color is real light brown! It upsets his ideas of steel and hardening. Really, the trouble is that the piece was not hard when taken from the water. Either it was not hot enough to harden when dipped, or else it was removed from the bath too soon and drew itself before the black was polished off. Test the piece as soon as taken out of the hardening bath—it is quite apt to prove soft. Remember that the same colors can be produced on a piece of mild steel but they do not indicate a state of hardness.

The Question of Cancellations

"I UNDERSTAND from a reliable authority," says C. H. Marfield, vice-president of the Seaboard National Bank, New York, "that the attempted and actual cancellation of contracts last year, 1920, involved five billion dollars' worth of merchandise, of which three billion was in dispute here and two billion abroad.

"It is to be regretted," he continues in "Bankers' Monthly," "that merchants in our country who have always been held in high regard and looked upon as men of the highest business integrity should, because they faced large losses under contracts entered into, endeavor to squirm out of their position by taking exception to some slight irregularity, which in normal times they would have paid but very slight attention to.

"It is a dishonor to the business men of the nation that such action was taken by our merchants. The banks were thereby placed in most embarrassing positions due to the fact that they were morally and legally bound to live up to the letters of credit issued by them and that by so doing they faced the danger of losing the right to call upon their customers for reimbursement if the drafts were honored after instructions not to pay.

"I feel that even if it is necessary for a merchant to suffer receivership, the agreement signed in establishing a letter of credit should be inviolate. A merchant who as a buyer lives up to his contract even though by so doing he suffers tremendous loss brought about by a condition over which he has no control is one to whom any bank would be only too ready to lend every possible assistance in getting back on his feet."

Insuring Safe Shipments

IN SPITE of damage by shipment, some concerns still feel little interest for the safety of their goods after they have been packed in what they believe are suitable containers, and are placed in the freight cars. Other firms, however, on account of the nature of their products have an added duty, which is to see that the goods are carefully packed in the cars to assure their reaching the customers in satisfactory shape. This applies principally to carload shipments.

One New England concern which manufactures an electric industrial truck, which weighs a little over a ton, is not satisfied to leave the safety of their shipments up to the railroad workers. A few years ago they gave it a trial, but the damages experienced in some of the shipments convinced them that it was not a good plan, so they have been sending men to the freight stations with their shipments. T. F. Moriarty, who tells the story in "Factory," says that the railroads are quite satisfied to let the concern do this because it saves them considerable time, eliminates claims for damages and besides they are hardly equipped for the work. Heavy pieces of lumber cut to size accurately and a large quantity of spikes are needed for each job and this material can seldom be located at the freight stations in the city where the shipments are made.

While the expense has been considerable the concern is satisfied and will continue the policy. The plan has eliminated all claims for damage to the trucks and has resulted in getting the machines to the consignees in perfect shape. As many of the trucks are sent on approval, it is worth something for the concern to secure safe delivery.

The Increased Use of Fuel Oil

FUEL oil, for use in oil burning equipped plants, has increased remarkably during the past year. J. J. Tyrell, in "Textile World," gives some interesting figures relative to this subject. Speaking of the oil burning boilers used by textile mills in New England and New Jersey, he says that approximately 50 textile plants with over 400 boilers were converted from coal to fuel oil. The oil consumption exceeds 4,500,000 barrels, displacing about 1,125,000 tons of coal per year.

The outstanding fuel oil installation in point of size, according to Mr. Tyrell, is that of the American Printing Company, at Fall River. The main storage consists of a concrete tank with a capacity of 640,000 gallons. This tank is about 30 feet from the boilers and oil is fed to the boilers by means of pumps. The storage tanks are provided with heating coils to hold the temperature of the oil to approximately 100°F. These heaters utilize the exhaust steam from the oil pumps.

In selecting apparatus to handle the oil some attention must be given to its quality; that is to say, whether it is light or heavy. It is my opinion, says Mr. Tyrell, that although the first cost of the apparatus to handle the heavier oil is greater, it is economical from an all-around viewpoint to install the apparatus to handle the heavier oil. Such installations will allow the engineer to take advantage of the market without regard to the nature of the oil.

Developments during the past year were chiefly concerned with the design and development of furnaces for high overloads. It is, of course, generally known that it is not economical to operate boilers on overload for any length of time. Yet, it is necessary to have them operate over short intervals to take care of big loads. In concluding, he says that the men who burn the oil ought to be given apparatus to guide them to the best way to get efficient results, and to be certain that they know the purpose of such apparatus when installed.

Keeping Track of Production

COUNTING and keeping record of production was always a problem in our screw machine department, says W. D. Kyle, in a recent issue of "Factory," and while it was a simple matter to count the finished pieces by hand or on a counting scale, we were always ignorant of the quantity of waste produced by our operators. Furthermore, there was always a tendency to overrun or underrun an order.

One of our men suggested the use of counting machines on the screw machines. The question then came up as to how to prevent a false count by the counter recording when the machines were running idle. We purchased a few counters to experiment with and were able to overcome this trouble by attaching them in such a way that the product itself tripped the counter lever. This entirely eliminated a false count when the material was used up.

This application worked out very well, so satisfactorily, in fact, that we have since equipped all our automatics wth them. This simple installation gives an accurate account of total production and entirely eliminates overruns and underruns. It also gives certain knowledge relative to the most efficient operators and workmen, which we heretofore could not attempt to estimate.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Eight contestants submitted correct lists for the Sept. 22nd contest. Following is how they were picked out in the elimination test. W. J. Lawrence, Montreal; G. Land, Peterboro; J. H. Wood, Toronto; Wallace A. Power, Niagara Falls; J. S. McElroy, Toronto; J. Strain, London; Ernest V. Bell, Fredericton; and Lewis W. Munsie, New Glasgow, N. S. As W. J. Lawrence was picked out first, he gets the scale.

CONTEST FOR OCTOBER 13TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1 Something that has a solid steel bar.
2 A case of more than forty years of service.
3 Something dating back to 1864.
4 How to reduce friction.
5 Something which can be produced at a minimum expense.
6 A product said to be non-breaking.
7—Something you should do each day.
8 How to effect big savings.
9 Something that is made available for use as fast as they can be handled.
10 How to reduce production costs.
11 Something you get upon request.
12 How to handle work quickly and safely.

These are Correct Answers for List from September 22nd Issue:

1—The Toronto Iron Works.
2—The L. S. Starrett Co.
3—The Northern Electric Co.
4—The Geometric Tool Co.
5—Hamilton Gear & Machine Co.
6—H. H. Robertson Co.
7—Nicholson File Co.
8—The American Pulley Co.
9—Brown & Sharpe Mfg. Co.
10—Armstrong Brothers Tool Co.
11—The Dalton Manufacturing Corporation.
12—The Carlyle Johnson Machine Co.

Closing Date for This Contest is Nov. 3rd

DEVELOPMENTS IN SHOP EQUIPMENT

FRICTION CLUTCH WITH POSITIVE LOCKING FIXTURE

The Carlyle Johnson Machine Co., Manchester, Conn., have modified the design of their friction clutches. This modification consists of their regular friction clutch with a positive locking feature added so that the load can be started under friction only, and when the clutch is completely engaged it thereby becomes positively locked against slippage so that the driven machine will be operated constantly at the speed of the driver without any possibility of slippage due to any variation in the load or any other cause. Where conditions exist that require such a type of drive as this the method which has been worked out of handling it by this design of friction clutch appears to be very successful.

The principle of the standard type of clutch is as follows. An outside shifter sleeve carries a sliding wedge between two toggle levers which expand the friction ring until its grips the opposing surface of the cup member. In the modified design the positive locking feature has been added. In opposing positions on the edge of the friction clutch and on the shoulder of the outside shifter sleeve are two pins. There are six pairs of opposing pins all together, spaced equally distanced around these two members of the clutch. When the clutch is disengaged both the friction surfaces and the positive pins are out of engagement. As the shifting sleeve is thrown in, the friction surfaces first begin to take the load and practically pick it up to full speed before the opposing pins come into contact. Then, the full throw of the clutch having been accomplished, the pins are in engagement, the clutch drives as a positively locked unit, and slippage under load is said to be impossible.

TRIPLE-GEARED LATHE

The Houston, Stanwood & Gamble Co. Cincinnati, Ohio, have marketed a newly designed heavy duty triple-geared lathe of 60 inch. swing. The bed of this machine is a one-piece casting, 42 feet long, and the total weight of the lathe is approximately 40 tons. The machine is driven by a 35-horse-power variable-speed motor mounted on the headstock. An additional motor is furnished on the left end of the apron, affording rapid power traverse to the carriage. Two steady-rests are provided, the larger having a capacity for work from 23 to 37 inches in diameter, and the smaller, for work from 2 to 23 inches in diameter. The jaws of these steady-rests have bronze shoes.

The various spindle speeds are obtained by operating the levers and handwheel on the headstock, and the different positions of these are designated by letters to enable an operator to determine a speed readily by referring to this speed plate on the headstock casting. The majority of the headstock gears have a pressure angle of 20 degrees. Lubricant is delivered to the headstock by means of a pump mounted at the rear of the lathe, which is driven from the motor shaft. To insure that the oiling system is functioning properly, an indicator is located on an oil-feed line from the pump to the headstock. This indicator has an aluminum wheel which spins rapidly when oil is flowing. The wheel may be observed through a glass at the front of its container. A device is provided to prevent oil from flowing up on the motor pinion and leaking out through the housing.

Several other features are incorporated, and in a test, a cut 1⅞ inches deep was taken on a 16-inch diameter, 0.50 per cent carbon, hammered steel forging, at a feed of ¼ inch per revolution and a speed of 15 ft. per minute.

DRILL CHUCK

The Wayne Tool Manufacturing Co., Waynesboro, Pa., have marketed a drill chuck, which is specially adapted for holding twist drills with broken shanks. This chuck, which is very simple, consists of only seven parts, namely, the shank, casing, two pawls, two screws, a casing plate. The drill is ground to a 60-degree point at the broken end, which allows it to automatically center itself in a 60-degree recess in the shank; and upon turning the casing, the drill is locked in place by two pawls gripping it above the grooves. No wrench is required to tighten or release the chuck.

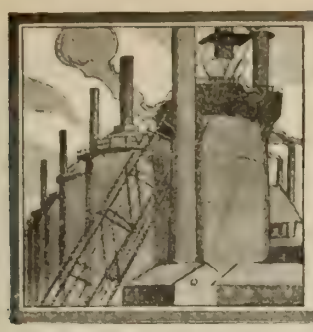
The Value of Apprentices

IN ANOTHER portion of the present issue we mention the names of seven Grand Trunk Railway apprentices who have been successful in capturing prizes for drawing at the 1921 Canadian National Exhibition at Toronto. Apart from the fact that these boys secured seven out of a possible ten prizes; we admire the calibre and talent of railroad apprentices in general. The seven successful contestants have real cause for pride, and in turn we as Canadians have reason to be proud of our railroad executives who have made possible the development of such boys. Apprenticeship on our railroads has been developed into an exact science. Hit and miss methods of training are no longer tolerated, and each boy is given careful tuition by capable instructors. Not so very long ago Canadian Machinery was privileged to sit through a session of one of the apprentice instruction classes at the G.T.R. shops in Toronto, and the clear and concise method of instruction appealed to us in every way. The earnestness with which the boys studied showed conclusively that they keenly realized the opportunity which was being afforded them, and the class of work which they accomplished proved they had grasped the lessons taught them.

The G.T.R. shops, in fact any railroad shops or manufacturing plants are doing a great work by this training of their apprentices, and in an indirect way they will be paid at some later date for any trouble they may be put to in the training of such boys. The Brown & Sharpe Company of Providence, R.I., have a very complete apprentice system, and one which costs considerable to maintain, yet they frankly admit that the class of boys they eventually turn out into full fledged mechanics well repays them for any effort expended. Likewise, the railroad shops produce the better class of railroad mechanics and engineers, men who have the interest of the G.T.R. at heart because they have grown up so to speak with the organization. Let us keep this thought before us regarding any apprentice. He actually represents raw material which can be either molded into a real mechanic or ruined through careless treatment. The moment a manufacturer takes a boy into his plant to train him for a mechanic, he is to our mind, responsible for the success or failure of such a lad. True, there may be those who never will become mechanics, yet who have chosen that as their life work. When a manufacturer is unlucky enough to find such a boy in his employ he should follow out the plan of the B. & S. Co., viz., tell the lad he is not suited to the trade. Such procedure may appear pretty cruel treatment, but we often have to be cruel to be kind. Let us boost the cause of apprenticeship and the need of proper apprentice instruction, for such boys will soon develop into ideal young men who will help to build up a still greater and better Canada.



Ability and Experience

ONE of the erroneous impressions existent in the business world to-day is that ability and experience can be bought without much difficulty. While these two qualities can be secured in some small measure, the average experience proves that it is a very one sided viewpoint that you receive. Even James Couzens, who was formerly vice president and treasurer of the Ford Motor Co. admits that he was sadly disappointed in this respect.

Speaking of how the Ford Motor Co. made its start he says: "We started without experience. As we grew larger, we tried to buy ability and experience—and failed. We had a unique business and when we brought men in from the outside—men with reputations—they invariably started to recast our affairs into their own molds. I do not undervalue training and experience, but a man with a reputation usually becomes so fixed in the ways that have made his reputation that he is fearful of failure if once he steps outside of them. If he remains flexible—if he uses his training as a background, then the training is of the highest value. But that seldom happens. Old dogs do not learn new tricks. They are too sure of the right and of the wrong. Especially are they sure of the wrong method—they know too many ways in which an end cannot be accomplished and thus they surround themselves with conventions. They are afraid of making mistakes—afraid of hurting their reputations. We all make a large number of mistakes. It is well to recognize that fact and not to attempt to disguise it. As has often been said, it is not the mistakes that count, but the repetition of them."

When a man such as Mr. Couzens admits defeat, one has to look around for the real method of securing ability and experience. To our way of thinking the sanest procedure is to start off by hiring men who are bright, intellectual, and faithful. Bring them up with the firm; and if possible give them an interest in the business, thus linking their own future with that of the enterprise with which they are associated. A star performer may be a whirlwind in some particular section of a business, but transplant him into another department and he may prove a regular dud. Above everything else, keep the loyalty of your executives and employees alive. Without loyalty success can never be attained, for to do his best a man's heart must be in his work and he must have confidence in his employers. Many a good executive has been nipped in the bud through shabby treatment.

A company that follows out a fair and square policy of promotion will never need to look around for ability. They will find it right in their own plant, and besides, the open market is not the best place in the world to look for a *real* executive. If a man is a capable worker, and is receiving good treatment, he is very seldom in the open market. Never hire a man that is one sided in his opinions for he will but blossom into a star. Secure men of broad understanding, men who see all sides of the question; train them the way you want them to go, and the result will well repay you.

MARKET DEVELOPMENTS

Confident Feeling Exists on Present Market

Steady Improvement is Noted—Steel Market Shows No Change In Prices—Small Tools Selling At Fair Rate—Tin Plate is Active Scrap Metal Remains Dull

THE VARIOUS markets report a steady improvement, although in no case is the change for the better very decided. It would seem as if the slogan "Better Safe than Sorry," had been adopted.

In Montreal the steel market is picking up, while in Pittsburgh no change of importance has occurred during the past week. Toronto reports a fairly steady market and better things are looked for as time proceeds.

The machine tool business goes on in a small way. If enquiries counted for anything business would almost be rushing, but unfortunately all enquiries do not materialize into orders. Dealers say, however, that they expect this branch of the market to open up shortly.

Small tools are selling at a fairly good rate. Practically no change has taken place in the demand, and up to date of writing, buyers are still persisting in the hand to mouth policy of purchasing. Dealers in this line say that sheer necessity will force manufacturers to open up before long. In fact one concern, according to a story existent, contemplates buying $50,000 worth of such tools as reamers, drills, fixtures, etc., etc.

The railroads in the U.S. have announced a reduction in freight rates on iron ore. This reduction is 28 per cent, and on the face of it looks good. The furnacemen, however, are not much pleased with the move, as they claim they are moving very little iron ore at present.

They have large piles of this material at the furnace. What is looked upon as the unfortunate feature of the matter is that this reduction will perhaps encourage pig iron buyers to look for lower prices on that commodity. Such a condition is very unlikely, because as the manufacturers point out, it will cost just as much to make pig iron as formerly until the present stock of ore is used up.

Tin plate continues to show remarkable activity for this time of the year, sixty-five per cent. or more of the tin plate mills being at present in operation, against 25 per cent. last June.

There is some talk of strikes occurring around April 1st, 1922, but as that is quite a period ahead, it is to be hoped common sense will intervene in the meantime.

FREIGHT RATES ON IRON ORE REDUCED WILL NOT BENEFIT FURNACEMEN MUCH

PITTSBURGH, October 13.—Conditions in the iron and steel trade have changed very little in the past week. Prices have shown no important movements, and the volume of demand is not materially altered.

The railroads announce a reduction of 28 per cent in iron ore freight rates, balancing the 40 per cent increase August 26, 1920. so that rates will be down to where they were before that advance, being still well above the level of 1914. The announcement is that the reduction will be only to December 31, but the trade assumes that the reduction will be permanent. The rate from Lake Erie dock to valley furnaces will decrease from 91 cents, to 65 cents, but so far as known there is no reduction scheduled in the dock charges.

While the blast furnacemen have been anxious to see rate reductions they are not particularly pleased with this move because of all reductions it is the one that will do them the least good. They are moving very little ore now and the reduction will hardly encourage them to move more. They have large piles of ore at furnaces. What the furnacemen consider an unfortunate feature of the matter is that the reduction will encourage pig iron buyers to look for lower prices on pig iron, whereas for some time to come it will cost just as much to make pig iron as formerly, since the ore piles have to be used.

If the reduction had been made on coke the case would be different, for the furnaces are moving coke every day. Doubtless the railroads realized the circumstances in picking on ore for the first reduction, and accordingly some furnacemen call the ore rate reduction "a play to the galleries." When the ore reduction really counts it will mean about 47 cents on the amount of ore needed to make a ton of pig iron. The freight on a ton of Connersville coke to the valleys is $2.52, and a 28 per cent. reduction on this would be 70 cents. or about 77 cents on the amount needed to make a ton of pig iron. Doubtless this will come some time, but the railroads would like to have it at once.

Production of pig iron in September was at the rate of about 12,000,000 tons a year, this comparing with rates of about 11,200,000 tons in August and 10,000,000 tons in July, the low month. Production now is probably at fully 13,000,000 tons.

Production of Ingots

Production of steel ingots is at 33 to 35 per cent of capacity, against 30 per cent in August, and about 12 per cent in July the low month. There has been no material change in the rate of production in the past two or three weeks, though there is some reason to believe that there is a slight tendency towards increased production.

Semi-finished steel is very sluggish, there being scarcely any interest in the market. Mills generally are holding sheet bars at the recently advanced price of $32 but it does not appear that the price has been paid thus far. Sales a few weeks ago were at a trifle under $30. In billets there is no action at all, and some mills do not have even a nominal asking price. Rods are supposed to be $41, by the recent advance, but the market has not been tested.

Bars, shapes and plates continue sluggish. The Carnegie Steel Company recently announced its prices at 1.65c for bars and 1.75c for shapes and plates. So far as known the company is adhering to these prices and that is not easily understood since some independents are ready sellers at 1.60c for all three

products. The 1.60c price, however, seems to be the minimum, and if so the market is firmer than a few weeks ago.

Hoops and bands are in very poor request, but mills seem to be adhering to a price of 2.25c, to which they recently advanced, probably on the theory that they can secure one price as easily as another.

Wire products show nothing important marketwise, since the distribution is almost wholly on old orders, booked before the advances of September 12, $2 on wire and $3 on nails, present prices being 2.60c on plain wire, 3.10c on galvanized wire and $2.90 on nails.

A little business is now being booked by sheet mills at the $5 a ton advance of some three weeks ago, but of course the chief operation is against the old orders. Whether the new prices will hold indefinitely is a question, but already some of the mills are discussing the prospects of another advance. Present prices are: Blue annealed, 2.50c; black, 3.00c; galvanized, 4.00c.

Demand for pipe mill products has been increasing slowly right along, but there is little improvement now. For standard steel pipe, demand is quite fair, but there is little being done in line pipe or oil country goods. Crude oil prices have been advancing rather sharply in the past ten days, and this would encourage drilling were the season not so far advanced.

Tin Plate is Active

Tin plate continues to make an altogether remarkable showing for this time of the year, since week by week production increases, 65 per cent or more of the tin plate mills being in operation, against about 25 per cent last June. The increased production is due partly to increased demand and partly to liquidation of mill stocks. Prices are quite irregular.

Pig iron is firm in the local market but distinctly inactive, transactions being light, and inquiry as well. The market is quotable at $20 for Bessemer, $19.25 to $20 for basic and $21 for foundry, f. o. b. valley furnaces. Quite a divergence of opinion has developed as to the future of the iron and steel market over the next three months. In some quarters the opinion has arisen that all the improvement to be expected for this year has already occurred and that there may even be a recession of demand by December. In other quarters it is held that general business is going to increase steadily, bringing a larger consumption demnad for iron and steel week by week, and that by early spring everything will be quite active again.

Fresh dangers of strikes have loomed up. It is reported that officials of the United Mine Workers and the railroad brotherhoods have made an alliance for mutual support. While the reports may be incorrect, or the plans may go astray, the story runs that the railroad men will defer to April 1, 1922, the strike they have appeared to be wanting, and the United Mine Workers will demand an advance for the two-year scale to follow the existing scale, which runs through March 31. The common view is that the present mining scale is altogether to high and that there should be a stiff reduction. Then on April 1, according to the story, the mine workers and the railroad men will strike and the railroad men will refuse to haul non-union coal, or burn it in locomotives.

POINTS IN WEEK'S MARKETING NOTES

Consumers are maintaining their confidence in the various markets, and the volume of business in several lines has noticeably increased.

Some of the Tank Cars for Russian Government are now on their way. This fortunately, was a cash proposition so that everyone in Canada was fully protected.

The machine tool market in Montreal is not very brisk. Idle equipment, which is said to be in good repair, is chiefly responsible for the present inactivity.

Pittsburgh reports that the iron and steel trade shows very little change during the past week, even to the volume of business closed.

Railroads have announced a 28 per cent reduction in iron ore freight rates. The present announcement states that the reduction will only be good until December 31st, although the trade expects reduction will be permanent.

Production of steel ingots is at 33 to 35 capacity, against 30 per cent in August, and about 21 per cent in July, the low month.

Hoops and bands are in very poor request, although on the other hand, the mills seem to be adhering to the 2.25c price, probably on the theory that they can secure this price as easy as any other.

Tin plate continues to make a good showing. The increased production is partly due to increased demand, and partly to liquidation of mill stocks. Prices however are rather irregular.

Rumor has it that America will soon see some further strikes. Common sense may intervene in the meantime so that the rumored strike may never take place.

Small tools are selling at a fair rate of speed and dealers in this line say they cannot complain.

CONFIDENT FEELING EXISTS ON MARKET

TORONTO, October 13th—A feeling of confidence exists on the market this week which is worth while in itself. Business is not of very large proportions, yet in spite of this fact, dealers in the various lines say that they are not worrying. "We see business ahead," said one dealer to Canadian Machinery, and combining all the opinions given by the various men, the former remark fills the bill admirably. Another dealer put it this way: "For the past few months" he said, "we have been working up a considerable number of prospects. This has taken both time and effort, but neither has been wasted, for we now see strong possibilities of this business being closed, and of course, needless to say, coming to us."

Men engaged in other branches of the market tell a very similar tale. Take for example the steel market. Practically every dealer we spoke to, told us that business was steadily improving. Every week shows a slight increase over the former, and while the demand is far from normal, it is as good as can be expected at this time of the year. A few months ago buyers of structural material were inclined to purchase by floors, instead of closing the deal at once. In other words they ordered enough material to finish the steel work on one storey, and then hoped before they required the material for the next storey, prices would be lower. Luckily, this foolish hand to mouth policy has practically disappeared. Buyers have at last realized that steel prices are down to practically production costs, therefore they are showing more confidence in existing figures.

Another steel dealer spoken to said that from now on he looked for good business. By the spring he expects the upward movement will have brought them up to a good high mark. Business so far this month seems to be ahead of September so far as orders are concerned.

Small Tools

The dealers in small tools are not worrying any these days. True, they are not working overtime to write up orders, but all things considered, they feel they are getting a fair share of the business that's going. If a graph was made of sales per month from January to September, or even up to the present date, the average line would almost be straight, for each month has practically been the same throughout the year. Where one month would drop, the next would rise, and so on, therefore the average activity is about even.

Machine Tools

The report in this market varies slightly. Some dealers say this month so far has been poor, while others again say their sales have improved. The situation can be summed in this way. For some time past these different dealers have been working up prospects. Naturally, they break at different times,

so that while one dealer may be getting his prospects up to the buying point, the other has managed to close the deal with his purchases, and so it goes. Enquiries still continue to come in, and although one cannot truthfully report the market as very active, we can say it could be much worse. To show how long it sometimes takes to work up a prospect, we ran across an order which was just closed a few days ago and which had been hanging fire over six months.

Scrap Metal Market

It would seem as if this market has decided to take a long rest. Nothing has changed since last week, and it looks as if this condition will hold good until foundries generally get busy again. How long this will take is problematical. At present it would seem as if spring would be the turning point, but there may be something happen before that will change the present inactivity in this branch.

The best message we can give this week is the feeling of confidence existent. Nobody is discouraged. Everyone feels the worst has been passed, and although not looking for a sudden improvement, they expect the upward trend will continue in a steady manner.

SLIGHTLY BETTER CONDITIONS PREVAIL IN THE LOCAL MARKETS

MONTREAL, October 13th—Slightly better conditions have prevailed in the local markets during last week. Consumers have maintained their confidence in the various markets. The volume of business in several lines has noticeably increased. The slow but persistent improvement indicates a more healthy condition than would a sudden improvement from an indefinite source. The present better tone of affairs indicates almost a state of business "convalescence." There is the disturbing factor however of the approaching Dominion Elections which has to be taken into consideration, especially in the case of larger concerns. The manufacturer is quite as interested today in discussing the probabilities of the tariff as he is in getting after new business. Thus any large undertaking of the manufacturers, will very likely be held up until after the results of the election are known.

Steel Market

Steel business is improving slightly. Prices have been down to almost an unprofitable point, and with the better condition of the trade, the outlook points to a stiffening in price. The railways have practically placed the orders for all rails, plates and joints that they expect to purchase before next season. Sheets and plates are moving more freely and there is a firm conviction among the jobbers that an upward trend of prices is coming very soon. Structural shapes are rather quiet and bars are moving slowly. The Canadian Car and Foundry Company are commencing to ship some of the tank cars on order for the Russian Government. These cars have required large stocks of material, and the tanks are being shipped separate from the trucks. The Canadian Government Merchant Marine Ships are carrying the cars from Montreal to Novo Rossick a port on the Sea of Azov. The attractive part of the whole transaction is the fact that is is a prepaid one, including the freight charges.

Most of the large mills have almost completed their arrangements for winter rolling, and only in a few instances, will mills remain idle, although they will all be working at partial capacity.

The prices of pig have been maintained throughout the week athough business has shown a little better trend. Foundries are not evidencing any tendency toward getting back to normal, and in consequence the volume of business from week to week only shows nominal improvement. The indications are that the winter months will be quiet ones but with the spring of 1922 business that has been deferred from time to time will be placed from sheer necessity.

Machine Tools and Supplies

In most of the machine shops to-day there is more or less idle equipment. These tools are in most cases, up to date, and in good repair. Thus before machine tools commence to move in any quantities, business will have to reach that point which will put this idle equipment into production. However, manufacturers are industriously endeavoring to refine their designs, and add improvements and at the same time reduce the manufacturing cost so that they can place on the market a class of tool that will be a real investment to the purchaser. It is useless to look forward to exceedingly large sales, in the future, of standard tools, of the class that has been on the market the last few years, because the war time demand for these tools was such as to place them in the hands of users in such quantities as to take care of all the business in sight for several years. Thus the machine tool manufacturer that improves his design or builds new revenue producing features into his machines and offers them for sale at a reasonable figure is the manufacturer that will be among the first to get back to one hundred per cent production.

The supply business has been gradually improving and the last few weeks are very encouraging and indicate a somewhat greater volume of business in shops. Little by little the effects of liquidation are gradually disappearing. Prices are again approaching a point where they are more or less staple.

Non-Ferrous Metals

The trading in all the non-ferrous metals has been more or less keen the last ten days. Copper has made one or two small advances and the demand appears to be much stronger. Zinc and spelter also have been moving quite freely, and prices have a tendency to strengthen. Canadian quotations locally are usually something of a compromise between the New York and London markets, and quotations are usually made from the lower of these markets. Meanwhile the small volume of business moving is gradually increasing and prospects are slowly improving. A greater improvement will be noted as soon as the foundries start to come into the market again.

Scrap Metals

Another week of stagnant conditions in the scrap iron trade must be recorded. As business in this section of the trade is dependent entirely on the activities of the foundries no change can be recorded until first the operations in the foundries commence. One can get almost any quantity of iron scrap for six dollars a ton, which price, even if there was a greatly increased demand, would hardly pay for the handling.

Trade Gossip

Mr. Gordon James, manager Canadian S. K. F. Company stated to Canadian Machinery this week that their business for the year to date had been quite satisfactory. A slight improvement had been noted during the past few weeks. Mr. James attributes their success to persistent sales and advertising effort. No town however small has been overlooked and every possible source of business has been prospected.

A building which will represent Italy may soon be erected at the Canadian National Exhibition grounds at Toronto. Messrs. Cavalier Guilo Ricchardi, Italian Consul-General for Canada, Mr. Jos. Glionna, Acting Vice-Consul and Chevalier Victor E. Gianelli recently conferred with the Exhibition Board regarding the securing of a site and were assured by the board that space would be available and that such a building would be available and that such a building would be a welcome acquisition. If Italy decides to erect such a building, it would bring the total number of countries wishing to be represented up to five; these being France, Italy, Japan, Cuba and Great Britain.

Hamilton, Ont.—William Butler, machinists at present occupying premises at 18 Mary Street, will move into larger quarters at the end of the present month at 17 Hunter St. West, Hamilton. After settling down in the new quarters, Mr. Butler informed this paper, that he expects to add to his present equipment by purchasing a 24 in. drill and a power hack saw.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

It is understood the Board of Education at Fort William are in the market for certain tools for their technical school.

F. F. Barber & Co., Foy Bldg., Toronto, have just completed arrangements for exclusive Canadian representation of the Warner & Swasey Company, Cleveland, Ohio.

Considerable activity is reported by machine tool dealers handling automobile cylinder regrinding machine . Machine shops and garages who have installed these machines appear to be doing a rushing business.

Dodge Brothers, Detroit, have purchased 35 acres at Sandwich, Ont., with 350 ft. water frontage, and according to reports the intention is to erect an assembling plant on this new location.

The Canadian Automatic Carburetor Co. intend establishing a plant at the corner of Royce Avenue and Dundas Street, Toronto.

T. & N. O. Railway extension work will be commenced this winter upon a 70-mile right-of-way northward out of Cochrane to Smoky Falls. The cost of the extension will be around $3,500,000.

Albert Francis, of Dunnville, will soon erect a foundry at Port Colborne. Three acres of land have been bought for the purpose.

Waterloo:—According to reports a large bricksyard will soon start up in this locality. Montreal capital is said to be interested in the new yard. The plant will be equipped with the latest and most modern brick making machinery and is expected to be in a position to cater to all kinds of trade.

James Bain & Sons, Hamilton, Ont., engineers and machinists report business as being very good and say that their present turnover compares favorably with the corresponding periods of 1919 and 1920.

The Hamilton Tool Co., Hamilton, Ont., are expecting a large order for a new line of patent motor truck radiators which they are manufacturing.

The McClean Machine and Tool Co., of Hamilton are manufacturing a new line of electric welding machines. It is claimed that these are the only welding machines of any type being manufactured in this country and a full description of these machines will appear in this paper at a later date.

John Carr, of the Carr Pattern and Tool Co., Hamilton, Ont., informs this paper that the above mentioned organization will move into larger premises about November 1st. The new factory is located at 108 Merrick St., and Mr. Carr says that they expect to purchase some new equipment in the way of machine tools at a later date.

Grimsby, Ont.—The Bay Mac Tire Co. are contemplating the erection of a factory which will cost around $15,000, and plans for same are now being prepared.

The Metabetchouan Pulp Co., Metabetouchan, Que., are erecting sulphite mill, sawmill, boarding houses and sheds which will cost around $750,000.

Toronto, Ont.—B. H. Prack, architect, 50 Bay St. intends calling for tenders shortly for the erection of a residence which will cost around $30,000.

Ottawa, Ont.—Tenders, no closing date set, will be accepted by David Arbuckle, 392 Daly Ave. for the erection of a residence costing $11,000.

Mr. R. J. Fleming, manager of the late Toronto Street Railway Co., has been appointed to the directorate of the Toronto Harbor Commission, thus filling the vacancy caused by the succession of R. Home Smith, as chairman, in place of the late Mr. Lionel Clark.

Considerable activity is reported by machine tool dealers handling automobile cylinder regrinding machines. Machine shops, and garages who have installed these machines appear to be doing a record business.

Brantford—The Dominion Steel Products Ltd., will shortly take on more men and if certain negotiations pending at present go through, it will mean a resumption of work to normal.

The Canadian Carpet and Comforter company, Toronto, are now running full time with complete staff. J. R. Syer, manager, expects business to continue good with them.

The capacity of the fifteen newsprint mills operating in Canada today is 3,412 tons a day or just over 1,000,000 tons a year. In this Canada is rapidly overtaking the United States whose production is running below 1,400,000 tons a year, after a total of 1,511,000 tons in 1920.

According to information received, the Waltham Motors Corporation of Canada, with head office at 9 Wellington street east, Toronto, intend manufacturing their motor trucks in Barrie. They have acquired the property of the Barrie Carriage Company and expect to move into this factory in a short time, and to be turning out trucks by the beginning of 1922.

It is reported that the Canadian National Railways intend buying equipment and supplies at an early date. If this is done it means considerable business for Canadian manufacturers in almost every branch of industry.

The Manager of a Toronto supply house says reports and business received from his salesman have shown a steady and encouraging improvement since June last. This company covers Ontario and Quebec with six men who keep in pretty close touch with all industries, large and small.

At a meeting of the Canadian Foundry and Metal Trades Association in Toronto, Friday, October 7th, the question of wages paid laborers by the city came in for some discussion and it was decided to support the Manufacturers Association and other bodies who will approach the City Council this week with hopes of getting the 60 cents per hour rate now being paid, reduced to 45 cents or lower. It is felt that the 60 cent rate now being paid in Toronto places an unfair burden on Toronto employers as they have to meet this rate while other manufacturers throughout the province are able to pay much less owing to municipal wages generally throughout the province being lower than Toronto wages.

"The Toronto office of the Independent Pneumatic Tool Company has been removed from 32 Front Street West to No. 163 Dufferin Street. The new location will give this company larger space and increased stock facilities. The Toronto Office will remain in charge of Mr. William McRae."

Tillsonburg, Ont.—The Shoe Co. in this town actually has to work 65 hours a week to keep up with orders. 160 hands are employed, and present orders are sufficient for at least another six months. In the other factories, these including all industries there, considerable activity is in evidence, and no unemployment is spoken of.

Toronto:—The Transportation Commision have 1,500 to 2,000 men engaged at present on re-habilitation work. Other activities that are to be pushed by the city are as follows:—

Grading and sewer operations will be done by the Works Department, this total reaching $107,100 and $692,300, respectively. The Street Commissioner is ready to go ahead with the new northern stables, which will cost $660.000. Other buildings to be constructed include the Reception Hospital, addition to College street fire hall, and the new fire station in Ashbridge's Bay, at an estimated expenditure of $40,000.

NEWS OF INTEREST FROM ALL SOURCES

THAT all indications point to a tremendous demand for machinery from the motor car industry, is the opinion of a Detroit dealer who is in constant contact with the situation. Referring, for example, to the manufacturers of one of the highest class cars in that city, he declared it, well known that their equipment was in comparatively bad shape, but that the directors would not give the authority to buyers to go into the market for a new outfit at the present tim. They preferred rather to conserve finances against a more propitious day. It is a fact that, during the war, and for some time afterwards, industries such as these had bought heavily, but eventually were confronted by the necessity to curtail. Even the Ford Co. in Detroit has become somewhat conservative, and dealers point out the buying for this concern is now done chiefly on a 30-day, rather than on the 6-month plan. This of course makes possible a conservation of finances at a time when such course is imperative.

When the demand was a more definite quantity and deliveries of material somewhat problematical, the 6-month plan was feasible. Even with the factories running as they are, the buyer on the 30-day basis has to hump some; but deliveries are reported to be good. It is not that the big industries are looking for better prices. Dealers report that a pretty reasonable level has already been reached without getting a rise of any proportions. When the time comes—and great hopes are pinned on next spring—the demand will be something exceptional.

The Fox Machine Co., Jackson, Mich., consider this a time for preparadness. To that end they are doing considerable experimental work in their shops looking to the improvement of their product and development of new ideas generally. This cannot always be done when the plant is running at normal and they expect to come out of the period of depression with something to demonstrate that the time has not been lost. The Fox multiple spindle tapping machine is an example. While the general construction is similar to that of their standard multiple drilling machines, there is some departure from previous constructions used. Former tapping machines made it necessary for the operator to follow the taps by raising and lowering the head with the hand pilot wheel. If he did not move the head fast enough taps very often pulled out of the spindles; if the head was crowded too hard, threads were liable to be stripped and generally, the services of o high grade mechanic were necessary. The new machine can be operated by an ordinary mechanic. The machine has full ball bearings in the countershaft and in the gear boxes at top of column. Spindle reversal is obtained by reversing clutches of the grab tooth type. They are located on the vertical drive shaft to the head. There is a single oxy plate clutch mounted in the gear box drive pulley, which clutch releases the load from the entire machine before spindle reversal takes place. The operation is simliar to shifting gears in an auto, the operation being, however, automatic. The reversal is obtained under heaviest loads in but a fraction of second, without shock to the mechanism within five thousands of an inch of the same depth on successive operations. While the capacity for tapping on these machines depends upon the number of spindles in the heads, experience has shown that the power required for tapping is about one third of that required for drilling a tapped hole.

Some equipment manufacturers report that it is a common occurence these days to have purchasing agents put through a requisition for this, that or the other machine or machinery—and a requisition is first cousin to a real order. Some of these days there will be a command for full steam ahead.

"Comes forward an American banker with the declaration that these great domestic influences are retarding the readjustment of prices and costs. Briefly, they are: First, delayed adjustment of prices and costs. Second, sustained high cost of transportation, preventing natural and normal movement of commodities to markets, and third, continuation of unsound taxation that diverts working capital from its proper channels. And he concludes, "In spite of these problems, the process of readjustment is going on and there have been undeniable signs of at least a modicum of improvement in the last few months. Every tep in the process of readjustment is doing its bit to restore the normal value of purchasing power to the entire people, and in the nature of things there is no room for anything but confidence in the gradual improvement of business."

R. H. Cunningham of R. H. Cunningham & Co., electrical engineers, Walkerville, was in Toronto this week in connection with installation of high speed and preheating furnaces at the Toronto plant of H. Disston & Sons, Limited.

Manufacturers report that in many quarters the fact that an election is in sight is regarded as an excuse for slowing up of effort. "During the war," he states, "the country was confronted by some pretty stiff problems, but "Business as Usual" saw it through. What I want to say now is that the country can't afford to let up while politicians fight it out. This is still going to be a pretty good country to live and work in and even after the election."

E. B. Kelly, Penberthy Injector Co., Windsor, has returned from a trip to Eastern Canada, and reports conditions much more favorable and a more optimistic outlook generally than was the case six months ago.

An association has been formed in England having as its object the control of rubber production in the East Indies, to prevent a repetition of the present glutted market. This new company is known as the Rubber Producers, Corporation, with a capital of about $25,000,000. The corporation is to obtain control of about 2,200,000 tons, against a normal of 400,000 tons. It is further estimated that the world's consumption of rubber this year will not be in excess of 250,000 tons.

ENGINEERING NEWS

Two of the new machines of the Abitibi Power & Paper Company at Iroquois Falls for the manufacture of newsprint are the largest in the world. They are 232 inches wide, and each machine is capable of turning out a sheet of newsprint paper over 18 feet wide and about 200 miles long every working day, or approximately 85 tons. To produce this output there will be required each day the pulpwood contents of 14 acres of forest.

Business, according to G. J. Morris, assistant to the general manager, of the International Business Machines Compay, is good. Their turnover for this year to date is 20% more than the same period last year. A large part of the sales are to retail establishments, but Canadian Machinery readers will be interested in learing that the sale of time clocks and recording devices used by manufacturing plants is steadily increasing. Mr. Morris said this would tend to show that manufacturing plants are reopening and buying equipment.

Building operations were on a larger scale during September than for the earlier month of the season. Fourteen industrial groups showed expansions in pay-rolls as compared with the preceding fortnight amounting altogether to nearly 6700 persons. The market for nickel is showing an improvement. Mr. C. C. Corless, General Manager of the Mond Nickel Co. states that the mining and smelting operations of the Mond will not be any further curtailed. The company has the greatest confidence in the turning of conditions generally for the better.

The towns centrally located in the mining district of Northern Ontario particularly in the gold mining district are enjoying a great wave of activity and are perhaps the busiest industrial towns for their size in the whole of Canada. Timmins is the town referred to. There is a payroll now of upweards of 2,500 men in connection with the production of gold, in addition to which is a big pulp wood, lumber and tie business, along the Matteagami River. Additional mines are on the verge of re-opening these including the Porcupine, V. N. T. North Crown, Schumacher. as well. as the Dome Lake and West Dome Consolidated. The mines are producing gold at the rate of not under 3 tons of gold bullion every thirty days valued at close to a million and a half dollars. The indications are that the next few months will witness a total of seven mines turning out gold bullion in this field alone.

PERSONAL

Mr. Blair of Alfred Herbert, Limited, was in Montreal all last week on business. He intended to engage a resident salesman while there.

E. F. S. Mattice, B.A.Sc. M.E.T.C., has been appointed as manager of the Phoenix Bridge and Iron Works Ltd., Montreal. Mr. Mattice is a graduate in the Faculty of Applied Science, McGill University, and for most of his professional career has been connected with the Dominion Bridge Co., latterly as its general contracting engineer. He was for several years president of the Structural Engineering Co., and has supervised the steel design of many of the largest buildings in Canada. He was also for some years special lecturer on structural steel design in the architectural course at McGill University.

Frank P. Jones, has been appointed president of the Canada Cement Co., Montreal. A. C. Tagge and Henry Jones Fuller were appointed to the two vice-presidential positions which were vacant. Vacancies on the board were filled by the appointment of Gordon C. Edwards, Ottawa, and T. A. Russell, Toronto, Mr. Edwards has been associated with the lumber business and is a director of numerous Ottawa companies. Mr. Russell is prominently associated with the automobile industry, although connected with several industrials. Mr. Jones has been with the Canada Cement Co. since the beginning of 1910, in the capacity of general manager, later being made a director and still later a vice-president. He was previously associated with the Dominion Iron and Steel Co., starting with them as sales manager and risingto be general sales agent, and from 1905 to 1910, general manager. Besides his connections with the Cement Company, Mr. Jones is president of the Consumers Gas Co., director Canadian Bank of Commerce, director Montreal Trust Company, director of Ontario Steel Products Company.

Some further additions have been made to the Board of Directors of the English Electric Company of Canada. Many of the men appointed hold high positions in industry in Great Britain. These are Lord Meston, K.C.S.I., Director and Chairman, Finance Committee of the English Electric Company, Ltd., of Great Britain; Lieut.-Col. Sir John H. Mansell, K.B.E., Director of the English Electric Co., Ltd., of Great Britain; and P. J. Pybus, C.B.E. Managing Director, the English Electric Co., Ltd., of Great Britain. The London Advisory Committee is also announced, with Mr. Pybus as Chairman. It will comprise also Evan Parry, B. Sc., Engineer-in-Chief of the English Electric Co., Ltd., of Great Britain. and two of the principal members of the engineering staff of the same company.

The Canadian directors of the English Electric Co., of Canada, are as follows: Gordon F. Perry, President and Managing Director, National Iron Corporation; Russell A. Stinson, Vice-President and General Manager, Canadian Crocker Wheeler Co., H. J. Dly, President, Home Bank of Canada; R. Home Smith, Director, Algoma Steel Corp.; D. H. McDougall President, Nova Scotia Steel and Coal Co.; and T. H. Watson, President, Canada Machinery Corporation.

Following are the directors chosen for the proposed international bridge which will connect Windsor and Detroit:—William B. Gregory, of Gregory, Mayer and Thom; A. A. Templeton, of the Detroit Steamless Tube Company; J. W. Austin, of the Detroit Graphite Company; A. H. Healy, banker, Windsor; W. J. Pulling, of W. J. Pulling & Co., Windsor; Hiram Walker, of Hiram Walker & Sons, Walkerville; J. O. Reaume, Windsor; C. S. King, of Walkerville; C. E. Fowler, chief engineer and J. H. Cullen, secretary. S. D. Callender, Detroit, and P. O. Pocock, Windsor, are the general counsel. According to preliminary estimates the bridge will be ready for traffic including street cars, early in 1924. The "Deck" for railway traffic, however, will not be completed for another year. The American Transit Company, of Detroit, and the Canadian Transit Company, of Windsor, will erect the span. The bridge when completed will be the longest and heaviest in the world.

MARINE NEWS

According to the Canadian Chamber of Commerce in London, Eng., a scheme for running a fleet of oil-burning steamers between Canada and England on a four day schedule is nearly completed. The vessels will make twenty-six knots and will carry 600 first class and 3,000 second class passengers. The plan provides for eight ships of 50,000 tons each. The service, as planned, will be confined to Canadian routes, but it is to be extended later to all parts of the Empire.

According to the monthly tonnage report, the freight tonnage through the canals at Sault Ste. Marie shows a decrease for the year up to October 1 of approximately 18,000,000 tons, and September tonnage this year decreased a little more than 5,000,00 tons compared with September 1920, according to the monthly tonnage report, made public today. The September total was only 6,482,073 tons, which was 1,015,276 under the August total. The decrease was shown by nearly all commodities. Iron ore fell off more than 5,000,000 tons from the September total last year. Flour registered an increase for the month of 896,145 barrels and 27,000,000 more bushels of grain were carried than in September, 1920. There were 2,008 fewer passengers for the season up to October 1 than were carried up to that date in 1920.

INDUSTRIAL NEWS

Garlock-Walker Machinery Ltd., Toronto have moved from 32-34 Front St. West, to 163 Dufferin St.

J. C. O'Brien, Manager, The Toronto Laundry Machinery Company, Toronto, reports the summer just past, as the most successful in their history as regard sales of the "Jack Frost" mechanical refrigerator. These machines are manufactured in two sizes only, the one ton for commercial use, and a smaller unit for domestic purposes.

The Westinghouse Electric International Co., New York, will supply the equipment for electrifying the Chilean State Railway between Valparaiso and Santiago and to Los Andes. The contract covers the most important railway electrification since the beginning of the war. The main line, which is 116 miles long, and is now under steam operation, is the most important in Chile. It connects the leading seaport, Valparaiso, with the Capital, while the line to Los Andes is 28 miles long, and forms the Chilean end of the transcontinental line to Buenos Aires. The contract, which has a total value of $7,000,000, was secured in spite of keen competition from German and other European concerns.

The Cyclone Fence Company of Canada, Ltd., which recently secured a Dominion Charter, has selected Hamilton as the location for its Canadian factory. The Canadian Co. is a branch or subsidiary of the Cyclone Fence Company of Waukegan, Ill., manufacturers of ornamental and industrial wire and iron fencing in the U. S., and the parent plant is capitalized at $1,500,000 having an annual turnover of approximately $5,000,000. It is not the intention of the Canadian Co., to build until building conditions become more normal. A short term lease has been taken of a portion of the Canadian Cartridge Co. building at Hamilton, and manufacturing operations will be carried on there for the present. The company has built a number of special automatic machines at its Waukegan plant for the equipment of the Canadian plant, and these are now being shipped to Hamilton. It is expected that they will be installed in time to commence manufacturng operations shortly after November 1. The Canadian plant will employ upwards of 100 hands and will be under the personal management of Mr. R. R. Reaume, one of the directors. Although a Canadian by birth having been born in Chatham, Mr. Reaume has been connected with the Cyclone Co. almost since its inception and as the head of the sales promotion department, has had much to do with the company's steady growth. According to Mr. J. P. Arthur, president of the American and Canadian companies, the protective tariff and high exchange rate are responsible for the Cyclone Co. deciding to operate a Canadian branch.

The New Geometric Solid Adjustable Tap

Answers the Question How to Reduce Production Costs

Where a machine has no means of closing a Collapsing Tap, or for some other reason does not permit the use of a Collapsing Tap, the Geometric Solid Adjustable Tap is the requisite between an Adjustable Collapsing Tap and a Solid Tap.

The Geometric Tap has the Advantage of use either as a Hand Tap or as a Machine Tap

The Tap is not equipped with the collapsing device, but has all the other advantages of a Collapsing Tap. Being adjustable, correct size is always maintained.

Chasers are readily removed for regrinding, and when finally necessary to renew the Chasers, this can be done at slight cost. A great saving over the renewing of an entire tap.

Each size Tap accommodates Chasers for a range of diameters.

Reducing Production Costs is no New Occupation for Geometric Screw Cutting Tools and Machines

GRAND TRUNK APPRENTICES HONORED

Seven Out of Ten Prizes Captured By Railroad Boys—Record to Be Proud Of

The results of the mechanical drawing competition held at the Canadian National Exhibition have been announced. The apprentices of the Grand Trunk Railway System have been exceptionally successful, having carried off seven of the ten prizes offered, taking first and second in each of the following competitions: electrical, structural, hydraulic.

This is a great honor, and the following are the prize winners—W. Grandison, F. Taylor, K. Murray and H. Bailey of the Stratford shops; W. Minton of the Montreal shops; F. Gooch, Toronto shops, and R. Harvey, London car shops. Since the inception of the mechanical drawing competitions at the Exhibition, the apprentices of this railroad have set a remarkably high record, which has certainly been well maintained this year.

The Grand Trunk Railway has always been interested in the development of apprenticeship training. There are more than 200 apprentices in the motive power and car shops of the Grand Trunk, and Vice-president W. D. Robb, who inaugurated the apprenticeship system on the railway, takes the keenest interest in maintaining the highest possible standard of instruction. This is carried out under a supervisor of apprentices. At shops where 50 or more apprentices are employed, there is a permanent class inspector, and at smaller shops, and at roundhouses, the instruction is given weekly by a travelling instructor. In addition there is an apprentice examiner, who examines all the apprentices at periodical intervals. The boys are moved from one machine or class of work to another, as their skill develops, and the instruction received in the shops is supplemented by classroom instruction in mechanical drawing, sketching, mathematics, practical mechanics and blue print reading. Evidence of the results obtained is found in the fact that the Grand Trunk has seldom been obliged to go outside of its own shops to fill the highest positions in its mechanical departments, while a large number of responsible positions in other railways are filled by men who obtained their early training in the Grand Trunk shops and apprenticeship classes.

WORK ON CANAL PROCEEDS STEADILY

Forebay is Completed And Electric Shovels Are Getting Near End of Their Job

One of the generators in the Chippawa power plant, the largest in the world, is ready, and another is nearing completion. It is expected that the water will be let into the canal sometime in December. According to reports, the forebay is completed and the electric shovels are getting near the end of their job. The control works at Montrose are well under way. Some bridges remain to be built. And the intake will not be constructed until next year. The coffer dam has been pumped dry, but the fingers or pipes through which water will be taken will not be put in place this winter. Nearly all the men now working on construction will be let off by December.

The removal of a "core" will let in the waters of the Welland and Niagara rivers. No ceremony will occur at that time, but when a few preliminary tests have been made, a formal opening of the power house for the generation of electricity may take place.

The new generator which is now ready has a capacity of 50,000 h. p. Five of them will be installed by next summer.

TORONTO SECURES NOVA SCOTIA COAL

Expect to Ship Coal Direct From Mines Believes This Will Overcome Shortage Troubles—Low Cost Said To Be Obtainable

Soft coal from the Sydney mines in Nova Scotia arrived in Toronto recently. According to Mr. Malone, western sales manager for the Century Coal Co., it is the intention of his company to deliver this coal direct by steamer to Toronto. Other steamers are at present en route to Toronto with further supplies.

Mr. Malone states that his company has succeeded in landing the Nova Scotia coal in Toronto at an economical cost, thus enabling them to meet the competition prices of coal from the United States. In this connection, Mr. Malone points out that the Turret steamers which are used have capacity for 4,000 tons. Owing to the limited depth of the Cornwall Canal they are obliged to lighter 2,000 tons at the bunkers in Montreal, the remainder of the cargo being brought direct to Toronto. After lightering her cargo in Toronto the steamer proceeds to Port Colbourne and loads grain for Montreal and other eastern points, thus giving the steamer the benefit of cargoes in both directions, the loading in each case, likewise, being accomplished in much faster time than ordinarily required to load freight consignments. This in itself, Mr. Malone states, makes it impossible for the company to compete with coal from the mines across the border. Under present conditions Toronto will be the western point of destination for the eastern coal until such time as the business develops and conditions at other points on the Upper Lakes warrant the transportation of this coal in that direction.

Assurance has been given by several large manufacturers in Montreal and members of the Montreal Harbor Commission that the Nova Scotia coal is equal in quality to that which is brought from Pennsylvania.

Mr. Malone believes that this will prove a practical solution in overcoming shortage conditions at certain seasons of the year, so far as soft coal for manufacturing purposes is concerned.

AUGUST STEEL OUTPUT SHOWS INCREASE

According to reports from Ottawa, the production of steel ingots and castings in Canada for the month of August, totalling 72,023 tons, was the highest month's output since November of last year. The Dominion Bureau of Statistics says that there was an increase of 25 per cent., or 17,698 tons, of steel ingots over last month's output. Basic open hearth steel accounted for the increase, August's total being 70,088 tons, as compared with 52,111 tons in July. The production of direct steel castings during August amounted to 1,684 tons, which was an increase of 347 tons over July's total. The quantity of pig iron and ferro-alloys produced during August was nearly 4,000 tons lower than of the previous month. The output of basic iron was considerably higher, being 46,939 tons, as compared with 40,720 tons in July.

Foundry iron production decreased from 10,339 tons in July to 1,882 tons in August. Malleable iron also declined during August. There was but a slight falling off in the output of electric iron castings, July's total of 105 tons being lessened by four tons.

ENGINEERING NEWS

Fort Willima, Ont.—An addition to the Bole elevator will be built immediately, and a $30,000 permit has been issued to C. D. Howe & Co., elevator architects and engineers of Port Arthur. The new structure will be 32 ft. square and 140 ft. high. The storage capacity of the new unit will be approximately 30,000 bushels.

WINDSOR—According to figures shown in the annual report of the Ford Motor Company of Canada, $37,836,400 worth of business was done by the company for the fiscal year ending July 31, 1921. After providing for all expenses and for income tax, the net profits transferred to surplus were $2,121,501.11, in addition to this must be added the sum of $231,12,7.96. Representing a balance remaining in the 1920 business profits tax reserve, making a total addition to surplus account of the year of $2,352,629.07. The output for the year was 46,832 motor cars and 3,063 tractors, compared with 55,616 cars and 2335 tractors for the previous year.

OBITUARY

John M. Gill, for many years associated with the James Smart Mfg. Co., as its president and general manager, died in Brockville a few days ago.

THE COMPLETE DRAWING

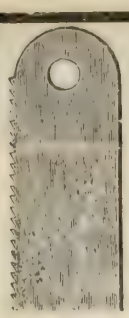
(Continued from page 37)

immediate reform at the seat of trouble.

To eliminate time wasted on reading drawings as far as possible also well pays for itself. A glance should be sufficient to give any information required and for a permanent impression on the mind.

A drawing that leaves room for doubt on any point is incomplete, unfinished, a constant source of time-wasting and possible error.

As a means of simplifying or eliminating complex card and paper systems, the day of the complete drawing has yet to come.



PERFECT PACKAGE MOVEMENT TO BE HELD

All trades and industries have been asked to co-operate in the "Perfect Package Movement" to be inaugurated by the railroads, steamship lines and express companies in the United States and Canada, in November, which has been designated as "Perfect Package Month." The purpose of the movement is to stimulate further public interest in good packing of shipments and to enable the carriers to improve the transportation service of the country. During November, an examination, of all shipments sent by freight or express, will be conducted, to obtain information as to the best shipping methods carried on by the various trades and industries.

In every city and town, the railroad and express people will form campaign committees, to co-operate with local shippers' associations, in carrying out the plans announced for "Perfect Package Month." "Exception Reports" will be made out for all faulty shipments discovered and these reports will be sent to the shippers' association for tabulation, to ascertain how high a percentage shippers in each city have attained.

Comparisons of the records made by the various cities will be announced at the conclusion of the drive, and the entire working forces of the railroad and express carriers comprising some two million men are with the movement. The railroads, through the American Railway Association, composed of practically all of the railroads in the country are pushing the campaign, as a means of raising the standard of the service, while the express agents are also getting ready to interest shippers in the undertaking. More on this subject will be announced at a later date.

3239. **Constructional Materials.**—A London firm buying for associates in India are open to receive regular quotation from Canadian exporters of iron and steel materials, machine tools, hand engineers' tools, and other engineering supplies required in India.

SIMONDS

Non-Breaking

Hard Edge Hack Saw Blades

When you put a Simonds Hard Edge Blade in your Hack Saw Frame you are assured of the maximum of cutting service, because these are the blades that cut fast, do not shell teeth, and when properly used they are non-breaking.

They are scientifically heat-treated and smoothly finished.

REAL FIRE BRICK SERVICE

When you buy Elk Fire Brick we sell you a brand with the qualifications equal to the duty for which it is intended. We do not recommend the best quality brick for a certain job if a lower-priced brand will stand up just as well. Each brand of

ELK FIRE BRICK

has some particular qualification which fits it to give better results in certain places than other brands we produce.

OUR BRANDS:

"Elkco"	"Keystone"
"Elkco" Special	"M.D. Elk"
"Elk Steel"	"Rotex"
"St. Marys"	"Elk Dust"
"Keystone Dust"	"Rotex Dust"

Try us on your next fire brick needs. You'll find both our quality and service right.

Large stocks on various shapes carried in warehouse in Hamilton.

Buying a Pig in a Poke

The buying of advertising space used to be buying "a pig in a poke." The quantity and quality of circulation was shrouded in mystery and often the bag was tied against investigation.

That day has passed. The advertiser no longer depends upon "mere claims." The Audit Bureau of Circulations has untied the strings to the sack and the circulation of the better class of publications is thrown open for the most searching scrutiny.

In buying advertising space in the Canadian Machinery you are not buying "a pig in a poke." Our A. B. C. statements will stand the analysis of the most exacting investigator.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Over eight pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

Satisfactory Cleaning Results For First Time in 15 Years

"This Advertisement is one of a series based on actual occurrences"

AT the time when prices for tin were at their highest, a large tin decorating establishment reclaimed and used all the tin sheets that they had spoiled and accumulated during 15 years.

This large saving was made possible by using Oakite cleaning materials to remove the litho inks from tin sheets that were misprinted and rejected at a rate which sometimes reached 5,000 sheets a day.

Many efforts had been made in the past, with other materials, to clean these sheets, but with no success.

Finally, an Oakite Service Man was given the problem. After careful investigation and preliminary trials, he worked out a method of cleaning with O.P.C. (an Oakite cleaning material) that reclaimed for use all the old sheets. Rejects are now cleaned and made available for use as fast as they can be handled.

Oakite Cleaning Service is offered without charge or obligation to any manufacturer. This service comprises a study of existing conditions and definite recommendations for improving cleaning results.

FLANGED FITTINGS

We have a large line of patterns for flanged fittings for low pressure, standard, extra heavy, hydraulic, superheated steam and extreme hydraulic pressures, ranging in size from one-inch to sixty-inch, and for working pressures from fifty pounds to three thousand pounds.

The dimensions of the low pressure, standard and extra heavy fittings are in accordance with the 1915 American Standard.

Pattern equipment for standard sizes and shapes is such that absolutely uniform castings are obtained.

Castings for special fittings also may be made at a minimum expense owing to our large equipment of special patterns which may be altered at very low cost.

P & W

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **Good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Van Horne St. - TORONTO

Repaired in 5 hours

MAINLY through the portability of Prest-O-Lite it was possible to weld the base of this heavy railroad crane in a few moments less than five hours.

That's the usual quick way in which it is possible to weld with Prest-O-Lite and the oxy-acetylene process.

Through the use of Prest-O-Lite it is possible to weld, build up and cut metals without bringing the work to be done to a workshop.

Thus Prest-O-Lite, the Universal Gas with the Universal Service provides the means for moving an oxy-acetylene welding outfit anywhere and everywhere.

You will be interested in the Nation-wide Service of our conveniently located plants and warehouses.

Pulleys that Cause Less Resistance Make Your Power Go Farther

DID you ever stop to think what percentage of your generated power was consumed in merely making the wheels go 'round?

If there are pulleys on the market that will deliver 25% more power to the work, or even 5% or 1%, they would soon pay for themselves at the present price of fuel, wouldn't they?

All right then—send for our booklet, "Getting Maximum Pulley Efficiency."

AMERICAN STEEL SPLIT PULLEYS

The American Pulley Co.
Philadelphia, Pa.

The AMERICAN PULLEY

A wheel with a broad rim transmitting power from or imparting power to machinery, or changing the direction of motion by means of a flat belt.

A file cannot be resharpened. Yet it is just as imperative for a file to be absolutely sharp as for a saw or chisel.

It pays to discard a file at the first sign of wear, and get a new one.

Maximum sharpness means minimum time and effort on a filing job.

These brands stay sharp for a long time, giving fullest service for money spent:

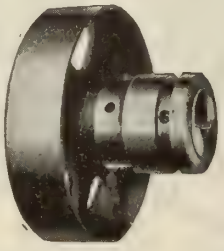
80 H.P. Morse Drive to Rolls, reverses direction every 45 seconds

THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

The Speed Line to Better Grinding!

FORD-SMITH

It's a pretty good time, right now, to get your manufacturing costs down to a **lower level!** How? Well, FORD-SMITH Grinding machines is one way. Consider the fact that from the many sizes there is one that will handle just the work that is now costing you more power and higher wages to have done on planers and shapers or other large machine tools. This is **logic** and it's being applied. It is worth investigating, so why delay?

FORD-SMITH Grinders can be operated by unskilled help—**a big saving in wages.**

In essential sizes and equipped with inexpensive work holders. Thoroughly tested before leaving the factory.

Let us tell you how to reduce your costs.

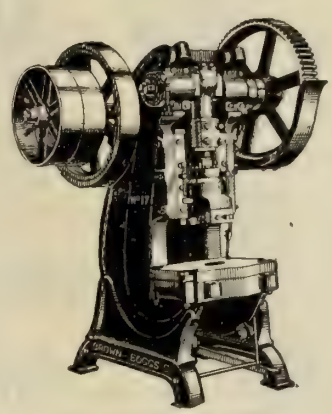
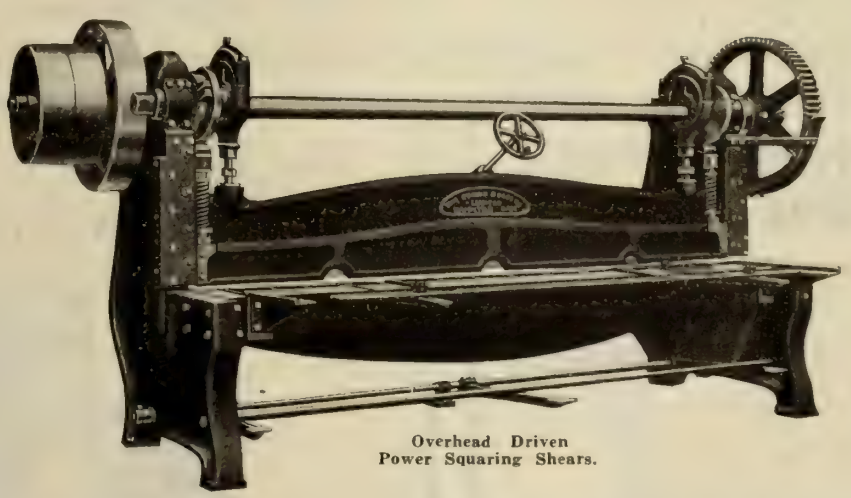
BROWN-BOGGS



B B

Old Friends and New!



Some people will tell you that there is no friend like an old friend. Quite true! But we often make new friends who prove their loyalty on short probation.

Whether you have known and used "B-B" Tools for years or are just making an acquaintance you will be bound to say the same thing. The smooth-running frictionless designs place operating costs at a minimum; while the in-built strength, and carefully chosen materials keep them that way indefinitely.

Every "B-B" product is rigidly tested and fully guaranteed.

No. 17—Power Press.

Overhead Driven
Power Squaring Shears.

Let us know the machine you are interested in and complete information will be promptly supplied. We make presses, dies, drop hammers, machine dies, shears, canners' processing machinery, evaporating machines, special machines and power presses for punching, forming, embossing, blanking, etc.

THE BROWN-BOGGS CO. LIMITED

HAMILTON, CANADA.

Every Tap User Can Double Production

by replacing carbon tool set ups with

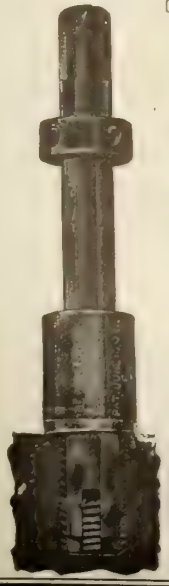
MURCHEY SOLID ADJUSTABLE TAPS

Besides enabling the machine to be operated at twice its former speed, MURCHEY SOLID ADJUSTABLE TAPS are economical! Economical because the high speed chasers, with which they are equipped cost no more than solid carbon tools yet actually cut **five times as many threads.** A fact worth looking into, isn't it?

The adjustable feature enables the chasers to cut full size until they are entirely used up. Then it's a simple matter to order new ones.

May we send you trial samples?

Murchey Machine & Tool Co.



75 Porter Street, Detroit, Mich.

Fenwick Freres & Co., Paris, France

Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself.

Write.

The Hammer With The Human Stroke

HEADS RIVETS COLD

Heads 'em tight or loose, flush, countersunk, or finishes heads any shape desired, and at the rate of:—

A rivet a second, sizes up to 3/16".
A rivet in two seconds, size ¼" to ⅜".
A rivet in three seconds, size 7/16" to ⅝".

And on special order we build machines to handle rivets up to 1½" with proportionate rapidity.

Built in eight sizes.

Besides riveting, the High Speed Riveting Hammer does all kinds of peining, swaging, upsetting, etc.

Send us sample assembly parts with rivets or sketch of your work,

and

Let us shoulder your riveting problems.
Send for the High Speed Hammer Book.

Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

Address it to

The Editor, Canadian Machinery
143 University Ave., Toronto, Can.

The illustration above shows the three protective coatings which provide an impregnable shield for the specially annealed steel which forms the core. An actual sample will be sent to you upon request.

R. P. M. on the Montreal Piers

Two great Transit Pier Buildings have just been added to the harbor facilities of the City of Montreal—the second largest port on the American Continent.

On these new piers, Nos. 18 and 19, approximately 1,000 squares of Robertson Metal have been used. Previous experience of the Montreal Harbour Commission, resulted in the choice of this protected metal for this vast undertaking.

The hundreds of repeat orders that have been placed for R. P. M. for industrial and public buildings is evidence of its ability to fully measure up to the requirements laid down by the Montreal Harbour officials. But metals so thoroughly protected could not perform otherwise. When three layers of weather, fume and gas resisting materials so completely encase the steel, both surfaces and edges, there is but one result—long life and truly economical service.

(1) Asphalt (2) Asbestos (3) Waterproofing is the order in which these protective coatings are applied—one firmly pressed into the other until a solid protecting sheet is formed around the steel. R. P. M. is made in corrugated, flat or mansard sheets for roofs and siding. It is also made into skylights, ventilators, building trim, downspouts, gutters, etc.—all building parts that need just the sort of protection against the elements that R. P. M. can be expected to give.

There are many installations in Canada, some of which can no doubt be conveniently inspected. We will gladly give you a list and arrange for such inspection. A sample of R. P. M. together with interesting literature will be sent upon request.

Some parts of your plant may need replacement. Let our engineers make suggestions and prepare estimates.

This partial list of users is significant because of the prominence of the various corporations and because all of them have used *Robertson Process Metal* repeatedly. Surely experience covering many years' usage is evidence of true value in the Robertson Product.

Let's Get Down to Business

SUMMER, with its dog-days, its vacations, its distractions, is over. We have had our holidays, our rest, our recreation. The Fall season, with its new opportunities for effort, enterprise and achievement, is upon us. Let us rip off our coats and get down to business. We may have allowed pessimism to grip us during the stagnant months of Summer. We may even have allowed laziness to enter our blood and our bones. It is now up to us to throw off both lassitude and pessimism. The time has come for action, for aggressiveness, for enterprise, for courage, for daring. Strong men make opportunities. Strong men do not supinely submit to conditions; they mold them. The business roadway has been cleared of almost all the weeds and rocks and swamp; begotten by the fatal war boom. The way is now open for a vigorous forward march. Let us cease looking backwards, let us cease bemoaning the hardships and the distress of the recent past. Let us look forward and let us go forward with confident unhesitating tread. Better times are within our reach if we will but reach out intelligently towards attaining them.—*Forbes.*

Canadian HART Wheels

Built in grades and grains for every class of work. Vitrified, Silicate, Shellac or Elastic Wheels

Made in Canada

For more than 34 years now Hart Products have stood for unvarying quality. If dependability means anything to you, ask for samples.

In the Busy Shop

the right policy is to keep always on hand a liberal reserve supply of abrasive wheels of the proper grades to cover every operation.

As soon as one wheel becomes worn it should be discarded at once because a new wheel costs less than the time used up by waste effort.

Another good policy, and one too often neglected, is to use for individual operations the kind of wheel designed for that work. If you are in doubt ask us.

Vitrified—Silicate — Shellac — these three grades will give you long service. Tell us the kind of work you do and we will choose the wheel you need.

Some interesting points about grinding can be gained from our catalogue. Ask for a copy.

AN IMPORTANT QUESTION

For the Advertiser to Answer

Is the Publication Soliciting Your Business a Member of the Canadian National Newspapers and Periodicals Association?

YOU would never engage a man on an important piece of work until you gained a thorough knowledge of his qualifications. It would not be wise. You first of all require a clear record of his character and ability, in addition to a statement of his aims and aspirations. When you are in possession of this information you have a real basis for judging his fitness to serve you.

It is just as important that you should know the character, ability and aspirations of the publication in which you desire to carry your business message.

You should know if the paper is circulating and has an influence among those men who are responsible for results—the men who buy, or influence the buying, of machinery, tools, power and any other equipment or merchandise which you may sell.

Facts are essential. When you are in possession of the facts you can make every dollar spent for advertising a judicious investment. To enable the advertiser to make such judicious investment is the purpose of Canadian National Newspapers and Periodicals Association. From this Association the advertiser may secure complete information concerning the character and aims of the leading Canadian publications. The facts are fully presented for your consideration—and they are presented RIGHT.

HEALD

Just an Atom of the Regrinding Possibilities

When you pass the thousands of cars parked on the streets or outside of baseball parks and country fairs, haven't you been amazed at the possibilities open for accessories and attachments provided you could only get the owners to buy?

Did you ever stop to think that there is a field now opening up which is as necessary as having the carbon taken out or the spark plugs cleaned, and every machine will sooner or later be a prospect?

We refer to cylinder regrinding, which is fast being recognized as one of the operations absolutely necessary every time the car is overhauled or where there is an excess use of gas and oil in proportion to the power developed—when the engine knocks—smokes excessively— or has lost all power and pep.

Already this is being handled in certain sections of the country and excellent profits are being secured by those who are properly equipped, but there are hundreds of localities where there is not a single shop to take care of this high grade work, that is just laying around waiting for someone with a little nerve, mechanical training and business ability, to go out and get.

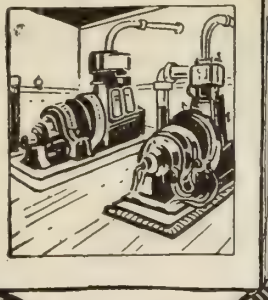
Think of it! There are 700,000 possibilities in Canada today, and only 12 shops Heald equipped to do this work. Furthermore, it only takes 3 four en bloc cylinders a day to bring in handsome profits to a two-man shop.

We are using all of our contracted space in the magazines to tell you of a business that, while it is only just started, is the most active mechanical line in the country today, knowing full well that once you have looked into it you will be sold, and that there is but one make of machine which will carry you through to success. That is a Heald built expressly for the regrinding trade.

Every manufacturer that grinds his cylinders uses Healds exclusively, and up-to-date regrinding shops find it will give more production in less time with greater accuracy and better results, than anything on the market today. These concerns will come out boldly and tell you so without making any bones about it.

If you are running a machine or jobbing shop and are waiting anxiously each day for hit-or-miss orders, you are losing money.

Opportunity stands at your door in the form of a Heald Cylinder Grinder. Heald and profits go hand in hand.



The field is increasing daily. It is up to you to change the course of the work that is passing your door, by writing, wiring or phoning.

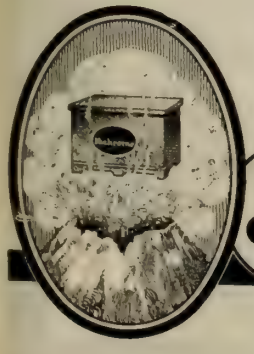
Thirty years' experience and dozens of practical men in your own line, stand ready to serve you. Let them! Subscribe for **your** paper to-day.

Men with selling problems will find a profitable tip in the statement made by a prominent manufacturer recently, "I use MacLean Publications because I am satisfied that papers with such a high standard of editorial excellence, **MUST** have an influential following."

How do You Measure Container Costs?

FURNACE hours may be your basis. Nichrome excels; Service records prove it.

Exacting requirements? Nichrome is the answer; the character of Nichrome users proves **that.**



Uniform results? Nichrome again; only containers that behave uniformly can produce uniform results and reduce spoilage to the minimum. Cast Nichrome Containers do not "grow" or undergo other changes in physical form that interfere with heat penetration. Heats are shorter.

Ask for Bulletin N-21

Whether economy or uniformly high quality in the heat treated parts, or both of these are your aim, Cast Nichrome is the container answer. The evidence exists in hundreds of plants—from the carbonizing of watch parts to heavy duty crank shafts. Shall we give you **more** evidence, based on **your** operating conditions?

Producing Valves by Means of the Turret Lathe

Depending on Style and Size of Valve the Method of Holding Differs—Swiveling Fixtures are Very Useful—Machining a Small Valve and a Globe Valve—Tool Layout is Very Important

By J. H. MOORE

FROM time to time we have presented through the columns of Canadian Machinery, notable examples of miscellaneous work as performed on turret lathes. There is no need to emphasize the fact that the turret lathe is now a well recongnized production factor, so we will proceed to explain how these machines have been used to advantage in the finishing of valves.

Depending upon the class and size of valves the methods of holding differs. For example, Fig. 1 shows the general plan of holding small valves, and as will be noted the part is held by special chuck jaws which bear against the flange at one end, while clamps bind down upon the top of the flange, this holding valve securely in place. Apart from these precautions, no further support is necessary on the small type of valve.

At Fig. 2 is shown a swivel fixture, this being another method adopted when holding small valves. From this view it will be seen that special supporting arms and angle plates are used, these extending out from the face of the chuck. It will be noted that the valve is held between two of these arms, and in this case the part is finished

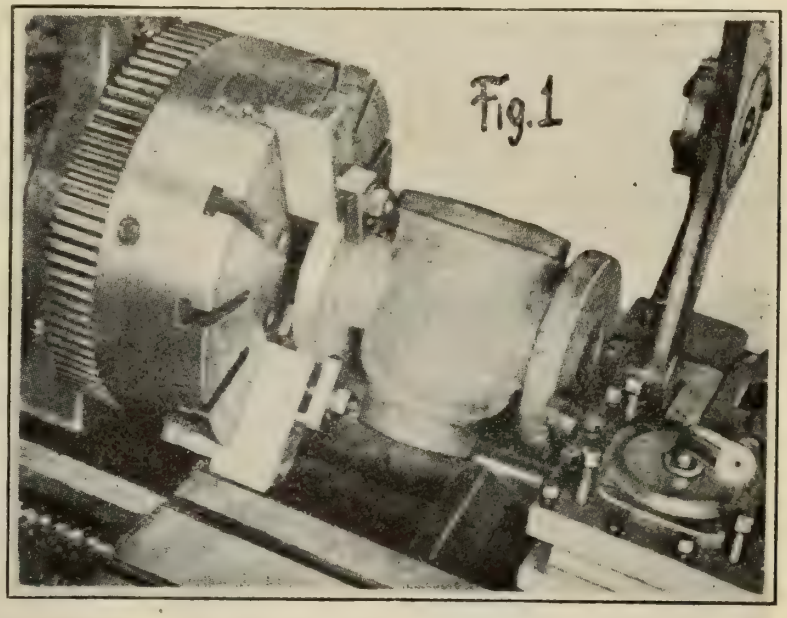

Fig. 1.—Method of holding small valves.

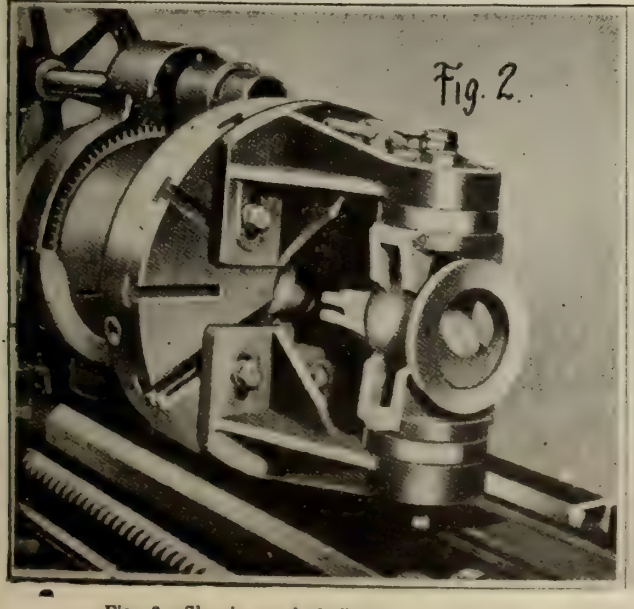

Fig. 2.—Showing swivel fixture.

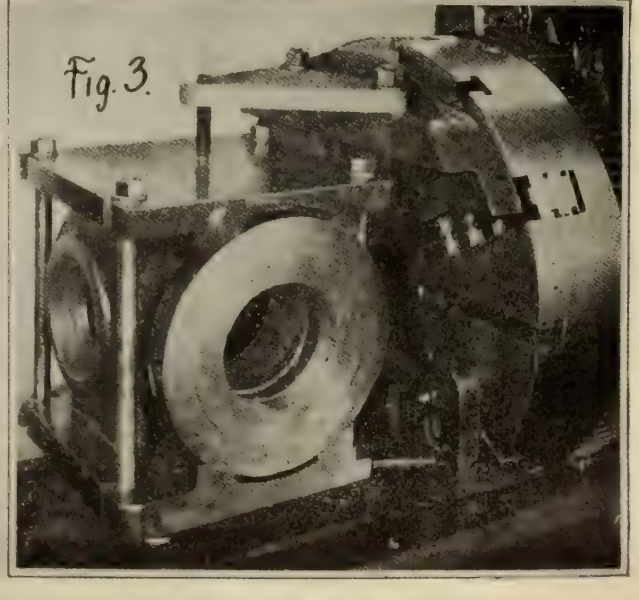

Fig. 3.—Fixture for large valves.

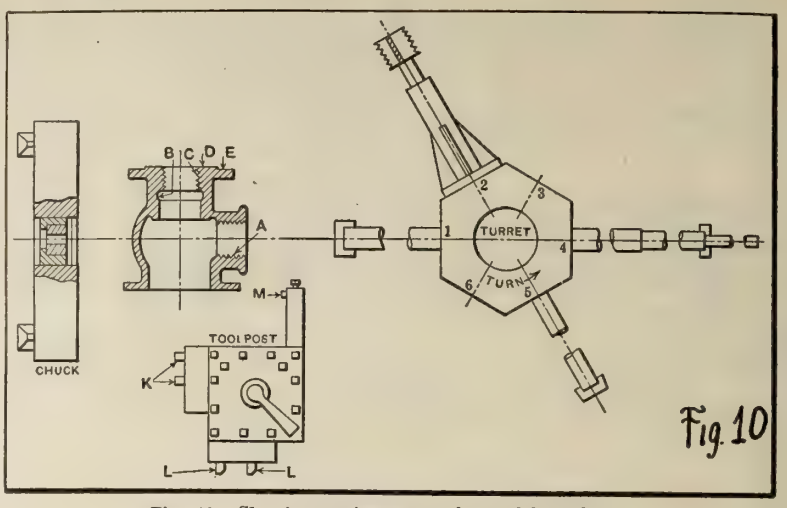
complete at one holding because the mounting can be so swiveled to present the different flanges to the tools. This really could be well considered under the class of a special fixture, as usually the simpler method of holding shown at Fig. 1 is adopted.

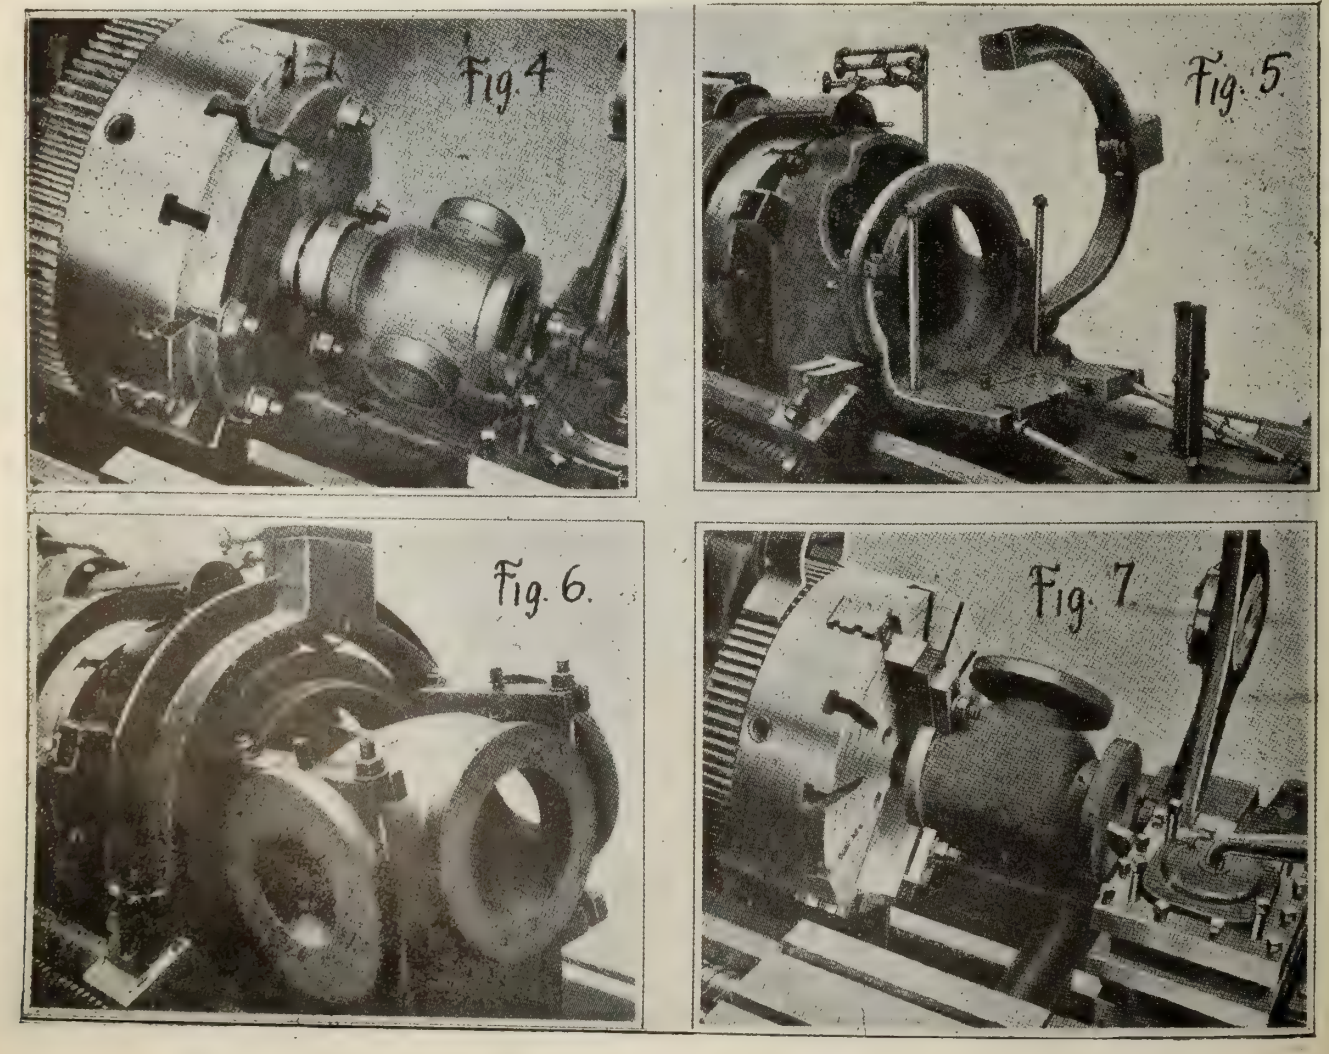
In machining larger valves of similar construction, a fixture similar to that shown at Fig. 3 is often used. This attachment is also of the swiveling type, although it differs somewhat in design.

It is so arranged that the valve can be indexed around to machine the two flanges, although as a rule the valve seat is not machined in this fixture, but is usually finished by holding it on a threaded arbor which enters at the end opposite the seat. This end is tapped to fit the arbor or stud, in order that the valve may be held as shown at Fig. 4.

This method of holding can only be used when there is a hole that extends entirely through the valve. One advantage of adopting this style of finishing is that where the valves have to be reseated in the field, they can be screwed on an arbor, and are then sure to run perfectly true.

Another method of holding valves is shown at Figs. 5 and 6. In the first photograph we see the fixture before the valve is placed in position, and in the latter picture we note how the fixture looks after the part is in place. Readers will no doubt notice that the arm of this fixture has a roller at the top, this bearing against the rotating part of the fixture in which the valve is clamped. Rollers are also provided at the sides (see Fig. 5) these being held in holders clamped to the vees of machine. By adopting this plan, the outer end of the fixture is thoroughly supported. Having explained these various methods of holding, we will proceed to the actual operations.





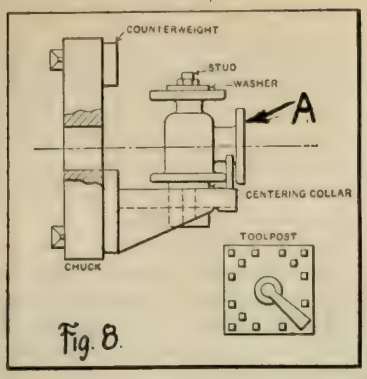


Fig. 10.—Showing equipment used on globe valve.

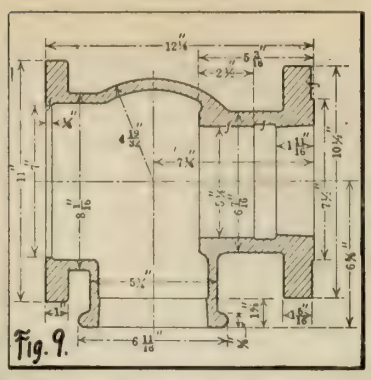
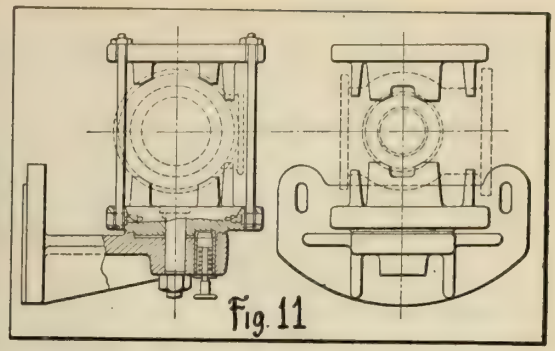


Machining a Small Valve



At Fig. 7 is shown a three way valve held by the method illustrated in Fig. 1. The three flanges have to be machined, the valve itself being cast iron. The first operation consists of chucking the

Figs. 4, 5, 6 and 7.—Refer to text matter for explanation.

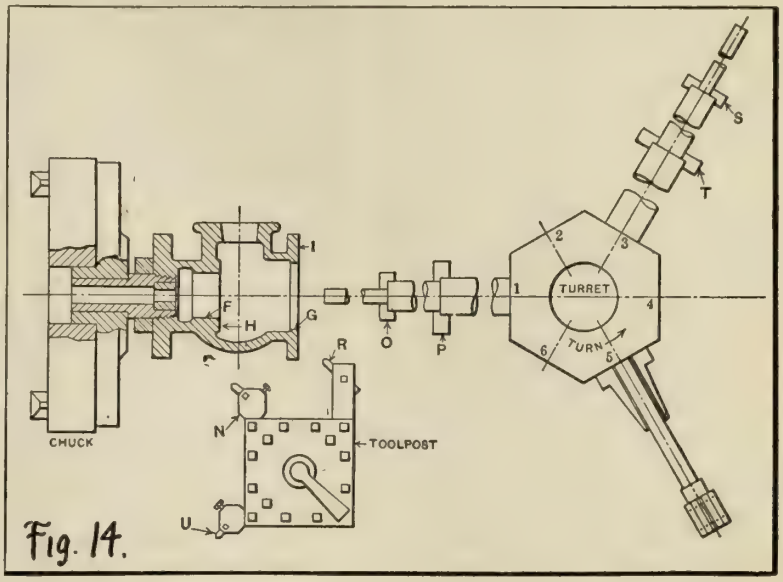
Figs. 8, 9 and 11, showing fixtures and part described in text.

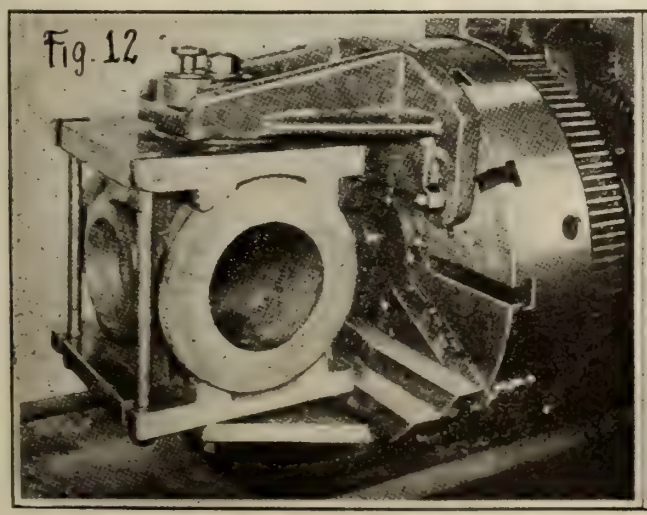
valve, then the flange at the opposite end is faced by a tool in the toolpost as shown. Five minutes for chucking and finishing this end is allowed.

In the second operation the valve is held by the finished flange while the opposite flange is machined. This takes another six minutes. The third operation, shown in Fig. 8, consists of finishing the face A with the tool in the toolpost. The valve is held on an angle plate which has a centering collar, and a counterweight is fastened on the faceplate to balance the weight of the angle plate. Uprights are arranged under the flange being finished, and screws passing through these support the flange sufficiently. The time on this third operation is 7 minutes. Instead of finishing the valve by holding it by chuck jaws as shown in Figs 1 and 7, the valve can be tapped at one end and held on a stud as shown at Fig 4, the object of this method having already been explained. Should the latter method be employed, the screwing of valve on stud, plus the facing of flanges, usually takes about five minutes.

Machining a Globe Valve

At Fig. 9 is shown a drawing of a cast iron globe valve and at Fig. 10 we see the tooling equipment used. At Fig. 11 is illustrated the fixture in which the valve is held while being machined. This attachment is of the swiveling type and is so arranged that the valve can be quickly turned around for machining the different flanges. Figs. 12





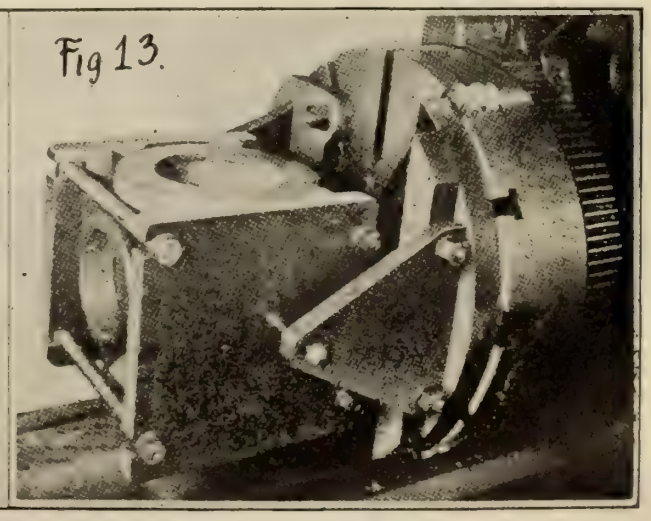


Fig. 14.—Showing tools used in marking valve.

and 13 depict the fixture in different positions. Readers will note that Fig. 13 shows the fixture turned around 90 degrees from the position in Fig 12. This shows up the construction of the fixture nicely. In machining this valve here are the steps taken:

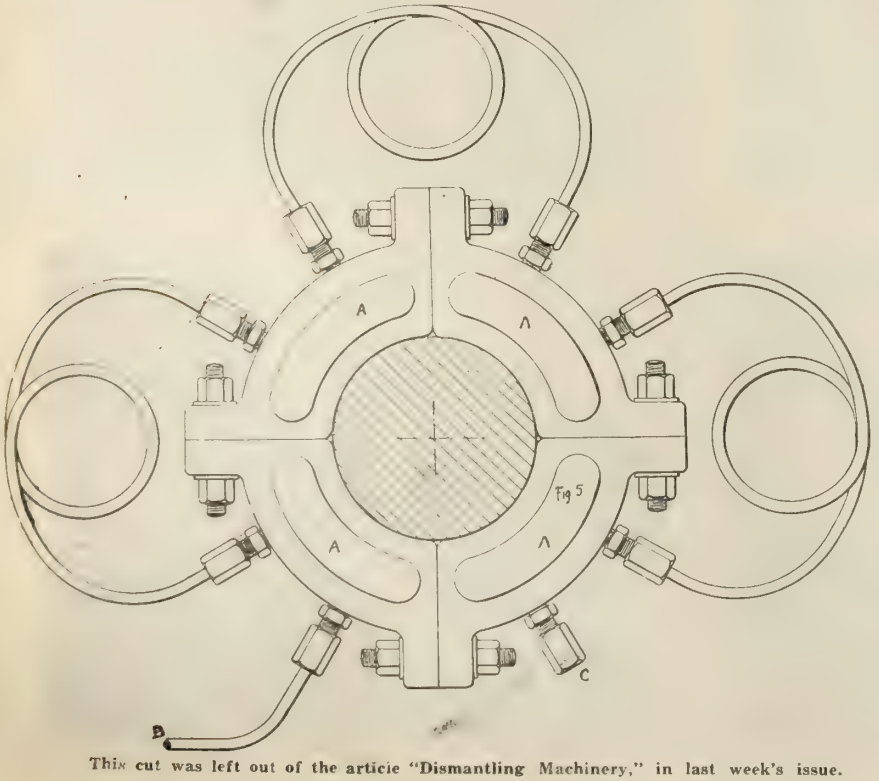
The part is first placed between the angle plates, being held in a special cradle as shown. The hole A is rough bored with a cutter held in the bar that is mounted in position 1 of turret, then this hole is finished with cutter held in the bar at side 5 of turret. After this, the hole is tapped with the tap shown at position 2 of the turret. When tapping has been completed, the fixture, with the valve in place, is turned round 90 degrees. The flange faces D, and E, are now rough faced with the tools K, shown in the toolpost. The hole C, is next rough bored with a cutter held in bar at position 5 of the turret, after which the faces D, and E, are finished with tools L, in the toolpost. The hole C, is then tapped with the tap at side

Figs. 12 and 13.—Showing the fixture in different positions.

2 of the turret, and 15 minutes is the total time for all these steps.

The second operation consists of facing and boring the valve seat. In this case, the valve is held on a threaded centre plug. Following are the steps taken to complete. The valve is screwed on the plug, and the flange I, is rough faced with the tool N. (see Fig. 14). The holes F, and G, are next roughbored with cutters O, and P, respectively, then the shoulder H, is faced with tool R, held in the toolpost.

The two holes F and G, are next finished with the cutters S, and T, after which the hole F, is reamed with the reamer shown at position 5 of the turret. The flange I, is next finish faced with tool V, which is held in toolpost, and the total time occupied in this second operation is 8 minutes.



In machining valves, or in fact any style of work in the turret lathe, there are certain points to watch. For example there is the question of holding the work. The tool designer should first make up his mind how he intends gripping the piece and in the case of valves, the size is an important consideration. Naturally it would not be wise to hold a large and heavy valve with a great amount of overhang in the same way as a small and light one. Where irregular outline occurs it means as a general rule that a special fixture is necessary and here is where the designer gets a chance to shine. Simplicity of design should be one of the main considerations, and of course accuracy and production are equally as important. When all is said and done the productive capacity of any turret lathe depends largely upon the tooling used, and the means of holding employed. Where production falls below the expected mark, do not blame the machine before looking into the equipment supplied by the designers. Many a machine today is not producing as it should, simply because those responsible for the tooling have been afraid to expend a little money on suitable tools and holding fixtures. The first cost of such equipment is soon wiped out by the added production.

AN UNFORTUNATE OMISSION

The feature article in last week's issue of Canadian Machinery was on the subject of "The Proper Selection of Grinding Wheels" by P. N. Cooke, sales engineer with the Norton Co. of Hamilton. On page 28 of the Oct. 13th issue we stated that the conclusion of this article would be found on page 36. Unfortunately the remaining portion of the article was left out, so in order that readers can grasp the full significance of the conclusion of this material, we repeat below the article from the last paragraph appearing on page 28. It starts as follows:

It cannot be claimed that grinding is an exact science. The wheel maker cannot determine the correct abrasive, grit and grade to supply and guarantee that it is the most economical wheel by mathematical methods alone. If he has compiled the figures such as were shown in table in Oct. 13th issue, these having been taken from experimental data, then there can be no question but that the wheel with the greatest efficiency has been attained. A great many people do not realize the great strides that this particular industry has taken during the past ten years. There are a great many machine parts today that are ground that were formerly produced by other methods. Grinding has played a large part in reducing the cost of hundreds of articles. It would be hard to name a modern machine which could be sold for its present price were it not for the fact that the correct grinding wheels are used to produce many of its constituent parts.

The wheel manufacturer is always looking for improvement. There are extensive laboratories where scientific research is carried on to develop better abrasives, improved grinding wheels and improved methods of operation, working toward more efficient shop methods, cheaper prdouction and greater accuracy for industry. The grinding wheel user will do well to keep in close contact with the wheel manufacturer to insure most up-to-date grinding practice in his shop. The chart shown last week was included to summarize in outline form the forgoing discussion and general explanation. It emphasizes more particularly the important points upon which grinding wheel selection depends and emphasizes the details which should be given to the wheel manufacturer to enable him to make the best recommendations.

This cut was left out of the article "Dismantling Machinery," in last week's issue.

USEFUL DATA

Tables of any kind are usually interesting, and quite often they are worth saving. Contract Record has published such a list, and for readers benefit wereproduce it below.

A cubic foot of lump lime weights from 60 to 70 pounds. A 200-pound barrel of lime contains 180 pounds net of lump lime, or 3.1 cubic feet. A 300 pound barrel of lime contains 280 pounds net of lump lime, or 4.7 cubic feet. A bushel of lime contains 60 to 80 pounds, or 1 to 1.3 cubic feet, depending on the state laws, and a pound of magnesium lime requires about one pound of water to form a paste, or about 25 gallons a barrel.

A barrel of lump lime gives from 6 to 9 cubic feet of paste; average about 7½ cubic feet. A cubic foot of hydrated lime weighs from 30 to 45 pounds, average about 38 pounds. A small sack of hydrated lime contains 40 pounds, or 1 cubic foot. A standard sack of hydrated lime contains 50 pound or 1¼ cubic feet. A large sack of hydrated lime contains 100 pounds, or 2½ cubic feet, and hydrated lime requires about an equal weight of water to produce a paste. A 100-pound sack of hydrate gives about 2.3 cubic feet of paste.

A standard barrel of Portland cement weighs 376 pounds net and contains 38 cubic feet. A sack of Portland cement weighs 94 pounds and contains about one cubic foot. It is usually considered as 100 pounds. Cement paste weighs about 137 pounds per cubic foot. One cubic foot of Portland cement will yield 8 cubic feet of paste. The average wooden wheelbarrow load of broken stone is about 2.4 cubic feet, and the average wheelbarrow load of sand is about 2½ cubic feet.

Elements of Machine Design—Lesson No. 2

Theory of the Beam—Method of Moments—The Couple—Examples—Shearing and Bending Stress In Beams—Bending Moment —Action of Forces and Other Points of Value

*By L. T. RUTLEDGE, B. A., Sc.

MANY of the writers of the older textbooks on machine design and elements of machines were accustomed to begin with a definition of a machine and then follow up with a list of elements. It was generally stated that a machine, no matter of what nature, or how complicated it might be, was an instrument by which force applied at one point was transferred to another point, being at the same time intensified or changed in direction. Then it was shown that elements of the most complex machine are reducible to what are called the six mechanical powers: (1) the lever; (2) the wheel and axle; (3) the pulley; (4) the inclined plane; (5) the wedge; (6) the screw. In this course of lessons these important and fundamental elements shall not be ignored but the study will be directed along different lines. We should prefer to define a machine in these words: "A machine consists of resistant parts, which have a definitely known motion relative to each other and are so arranged that a given form of available energy may be made to do a desired form of work." The study of machine design is chiefly concerned with the determination of the proper shapes and dimensions to be given the component parts so that they may be sufficiently strong and stiff enough to carry the loads and transmit the forces. Whereas, if we were to confine our attention to the motions of the machine parts, the study would be called kinematics of machinery.

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should an yreader wish help in any problem on mechanical matters, Mr. Rutledge will be only too pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

Machines and all mechanical structures in general, consist of combinations of the simple structures or fixtures, namely, beams, short and long columns, brackets, shafts, ties, fastenings, flywheels, pulleys and gears. This present lesson will be devoted entirely to the theory of the beam because it is of paramount importance. So many fundamental principles have to be learned, new quantities which in some cases are very abstract in nature are encountered, and so many new conceptions are acquired in the study of the beam that it must be given first place.

The principle of the lever enters into most mechanical problems and by its aid reactions may be determined as well as the stresses in the various members of a framed or machine structure.

If a force acts on a body tending to rotate it about a certain point, it is said to have a moment about that point equal in magnitude to the product of the force(in pounds or tons) and the perpendicular distance from the line of action of the force to the said point. In Fig. 4, the force F, acts about the point A, with a leverage equal to d. The point A, is called the point of moments and the distance d, the lever arm. The moment of the force F, equals Fd, in ft.-lbs., if d, is expressed in feet and F, in pounds.

There may be two or more forces tending to revolve the member about a point either in the same or opposite directions but when a body is in a state of equilibrium the algebraic sum of the moments must be equal to zero or in other words the sum of the clockwise moments must equal the sum of the anti-clockwise moments. When we use the expression algebraic sum we always mean an addition which takes into account the direction as well as the num-

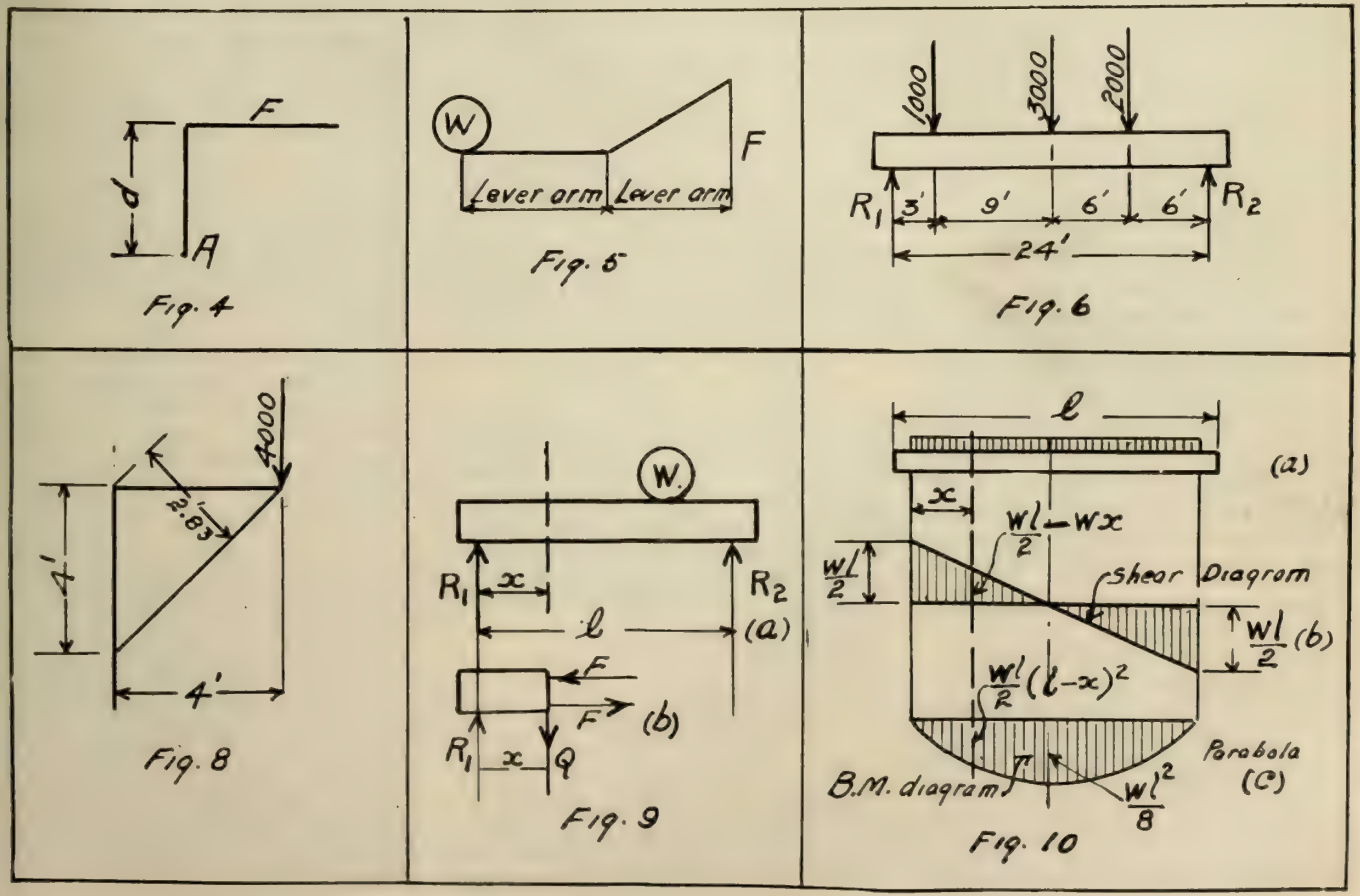


Fig. 4 Fig. 5 Fig. 6

Fig. 8 Fig. 9 Fig. 10

concentrated load W. The reactions due erical sum. For example, the arithmetic sum of two forces of 8 and 6 pounds is 14 pounds, but if the two forces are acting in directly opposite directions with the greater in the assumed positive direction then the algebric sum is +2 pounds.

In machine parts the levers are not always straight but very often bent; but no matter what the actual length of the lever member may be, the true lever arm for purposes of moments is the perpendicular distance from the point of moments to the line of action of the force. Fig 5 is an example of a bent lever.

The moment of a force about a given point vanishes only when either the force vanishes, or the line of action of the force passes through the point of moments. This fact is of great importance as will be seen later as it enables one to find two unknown forces in a system of forces by arbitrarily taking moments first about a point in the line of action of one of the unknown forces.

The following are two generalized statements of the Principle of Moments: 1:—If any number of forces in one plane acting on a rigid body, have a resultant, the algebric sum of their moments about any point in their plane is equal to the moment of their resultant about that point.

2.—If the forces are in equilibrium, their resultant is zero. Therefore the moment of the resultant about any point in their plane is zero. Hence, when a number of forces in one plane acting on a rigid body are in equilibrium, the algebraic su mof their moments about any point in their plane is zero.

The following are the sufficient conditions of equilibrium when a number of forces act on a rigid body in the same plane. 1:—The algebraic sum of the forces resolved in any two directions must vanish, and 2:—The algebraic sum of the moments of the forces about any point in their plane must vanish. It is to be noted that both of the above conditions are to be satisfied.

The Couple.

In this particular, it is well to note a special case of a turning moment known as a couple. A couple is a system of two equal forces acting in opposite directions If each of these forces be represented by F, and the perpendicular distance between them by y, then the moment of the couple equals Fy. A couple tends to rotate the body upon which it acts, and can only be balanced by an equal couple acting in the oposite direction.

Examples Illustrating Methods of Moments.

Example 1:—In Fig. 6 is shown an ordinary simple beam supported at each end and carrying three concentrated loads spaced as indicated. The end reactions R1 and R2 are unknown. But the beam is in equilibrium. It is required to find the end reactions. A practical example of the case would be a floor beam supported on two brick walls and carrying machines on the floor above spaced as given. Going back to first principles we may assume the beam to be a lever, pivoted at one end and supplied with an upward force at the other end. Then the sum of the moments of the loads about the pivoted end of the lever must be balanced by the moment, about the same point, of the reaction or upward force C at the opposite end. Fig. 7 shows the directions of the turning moments.

Assuming that the beam is pivoted on the line of reaction of R2, the sum of the moments about this point must be equal to the moment, about the same point, of the reaction of R1, the equation of moments is given as follows:

1000 x 21 + 3000 x 12 + 2000 x 6 = R2, x 24, the unit of measurement of each product being the foot-pound.

Then 24 Rl=69000, which gives Rl =2875 pounds.

To obtain the reaction R2, moments may be taken in the same way about the line of action of R1 and R2 and will be found to be 3125 lbs..

However, after R1 is found by moments, R2 can be obtained in a much simpler way. Since the forces are in equilibrium, the algebraic sum of the forces resolved in any two directions must vanish. Here we are only concerned with the vertical direction. Then to find the unknown force we have the equation R1 + R2—1000—3000—2000 =0.

But R1 was found to be 2875, then R2 must be 3125 to satisfy the equation. In more simple language, it may be stated that the upward forces must balance the downward forces, both being vertical.

Example 2:—Fig 8 represents a bracket on the side of a wall similar to a bracket used to support a crane rail in a machine shop. The load on the bracket is 4000 lbs, at the point B. For the stress in AB, moments are taken about the point C. The moment of the load about this point equals (4000x4) ft.-lbs., while the resisting moment about the same point is equal to the stress in AB multiplied by the lever arm AC. The condition for equilibrium is that one moment equals the other. Therefore 4000x4 equals stress in ABx4. Therefore stress in

$$AB = \frac{4000x4}{4} = 4000 \text{ lbs.}$$

For the stress in the member CB moments are taken about the point A. The moment of the load about this point is the same as before and the resisting moment is equal to the stress in CB, multiplied by the leverage arm of the perpendicular distance from A, to the member BC, which distance is indicated as 2.83 ft. Then

4000x4 = stress in CB x 2.83

Stress in

$$CB = \frac{4000x4}{2.83} = 5654 \text{ lbs.}$$

2.83

Shearing and Bending Stresses in Beams.

Fig. 9 (a) represents a simple beam supported at both ends and carrying a to the weight W are represented by R1 and R2. Thus the load and the two reactions are the only external forces present which induce internal stresses, it being understood that we are here neglecting the dead weight of the beam itself. If we imagine the beam to be cut between the load W, and the reaction R1, or in other words, if a section of the beam be taken as shown at (b), then the remaining portion of the beam may be held in equilibrium by a downward vertical force Q, which is equal to the upward reaction R1, and by two equal but opposite horizontal forces F, applied near the top and the bottom of the section of the beam along the line of section. The force Q, which is called the vertical shear, tends to cut the beam crosswise and is resisted by the strength of the material in this direction. Again R1, and Q, form a couple, the lever arm of which is the distance x, and this couple tends to rotate the section of the beam in a clockwise direction. The moment of this couple is called the BENDING MOMENT, at the section under consideration. Now the horizontal forces F, also form a couple with lever arm equal to d. This couple tends to rotate the portion of the beam in a counterclockwise direction, thus counterbalancing the bending moment. The moment of this couple is called the RESISTING MOMENT. For a condition of equilibrium these two moments must be equal, or R1x=Fd. from which

$$F = \frac{R_1 x}{d}$$

The forces F, which may be infinite in number, induce compression in the upper fibres of the beam and tension in the lower. There is a horizontal plane where the stress is zero. There the stress changes from compression to tension and in order to do this it must pass through zero. The plane is shown on the sketch by a line which is known as the NEUTRAL AXIS. It is now obvious that a loaded beam is usually subjected at any section to two kinds of stress, namely, vertical shear and bending.

Vertical Shear.

The vertical shearing stress causes the particles in the beam to tend to slide past one another in a vertical plane. An example of vertical shearing is found in the vertical shearing of boiler plate in a shearing machine. The vertical shear at any vertical plane is equal to the algebraic sum of all the vertical forces on either side of the plane. When the direction of the shearing stress is such as to cause the particles to the left of the plane to move upward with respect to the portions of the beam to the right, it is usually said to be positive, whereas if the shear causes the left hand section to move downward relatively to the right hand section, the shear is considered negative Many authors define the shear as the algebraic sum of the vertical forces to the left of the plane. This definition

is correct in itself, but too restricted for one can convince himself that it does not matter which side of the plane one selects to sum the forces by taking an actual example. For instance, take the forces shown acting on the beam in Fig. 6, and find with them the vertical shear at any plane. Suppose the plane is chosen between the forces 1000 and 3000. The vertical shear is +2875—1000= + 1875, when taking the forces to the left of the plane. Considering the forces to the right we have + 3000 + 2000—3125= +1875, the same as before and positive in each case according to the convention of signs.

Bending Moment

The bending moment (B.M.) at any point of a loaded beam, is equal to the algebraic sum of the moments about this point of the external forces on either side of it. This moment must be balanced by the resisting moment at the same point of the internal stresses in the material. When the bending moment induces compression in the top fibres of the beam, it is usually considered as positive, but if it induces tension in the top fibres it is considered as negative. This assumption is a pure convention. The necessity of some uniform system at the very start can be clearly seen.

Fig 10 (a) represents a beam loaded uniformly with a load of w.lbs. per linear foot. Each end reaction will be wl, being half of the total load on the

$$\frac{}{2}$$

beam. At each end there are equal but opposite forces acting on the beam, one-half of the total load acting downwards and the reaction of the support acting upwards, each equal to wl, divided by 2.

These two forces tend to shear the beam in an up and down direction. The vertical shear at each end of the beam the length x; or the shear at

$$x = \frac{wl - wx}{2}$$

on the left being positive and the one on the right negative, according to our rule of signs. These quantities can now be shown in a diagram to a selected scale. The positive shear is drawn upwards and the negative downwards. The shear at any arbitrarily chosen plane, say one at the distance x from the left support is equal to the reaction at that support minus the load on the beam in the length x; or the shear at x $\frac{wl - wx}{2}$

The variable quantity x is to the first power which shows none familiar with simple analytical geometry that the above equation can be represented by a straight line. In other words, the variation in shear as the distance x is being increased, is directly proportional to the distance. Then the shear diagram may be completed by joining up with a straight line, the extremes of the ordinates at the left and right hand supports. At the cenre of the span where the line crosses the axis, the shear is zero

The bending moment at any plane distant x from the left hand support is equal to the algebraic sum of the moments of the forces on either side of the plane. Let us now consider the moment for the left side, but precisely the same answer would be obtained had we selected the right side. The upward force is wl. The downward force is the uni-

$$\frac{}{2}$$

form load equal to wx. For purposes of calculation this uniformly distributed load of wx may be taken as acting at the centre of the short distance x so that the lever arm is x. Then the mom-

$$\frac{}{2}$$

ent at plane distance x is equal to.

$$\frac{wlx}{2} - \frac{wx2}{2} \qquad (6)$$

Equation (6) is the equation for a parabola with vertex at the centre of the span. Where the equation contains only one variable and it is raised to the second power, it is a good indication that the parabola will represent the variation. It is certain it cannot be a straight line. In Fig. 9 (d) the parabola is drawn and the bending moment diagram completed. The ordinates or vertical lines drawn from the horizontal line connecting the ends of the parabola represent to scale the value of the bending moment. The scale of the B.M. diagram will generally be so many inch-lbs or foot-lbs. equals one inch. It is observed that the B.M. is greatest at the centre where the shear was leat. This maximum value of the B.M. is Mmax= wl2.....(7). Now if W be let equal

$$\frac{}{8}$$

wl equal the total load, we have Mmax =wl ..... (8). This is the more

$$\frac{}{8}$$

usual form in which the expression for the value of the maximum bending moment of a beam uniformly loaded is given.

For a beam with a concentrated load at a distance x from the left hand support, the same method of solution applies. The positive shear under the load is W (l—x..... (9)

$$\frac{}{l}$$

and the negative shear is equal $\frac{Wx}{l}$

When x equals zero the positive shear is equal to W, and the negative shear equal to zero. The bending moment diagram is constructed with straight lines and it will be found that Mmax.=

$$W \frac{(l-x)}{(l)} x \qquad (10)$$

When the concentrated load is at the centre of the span we have

Mmax.=Wl ..... (11)

$$\frac{}{4}$$

The student is advised to work this case out in full and draw the shear and bending moment diagram.

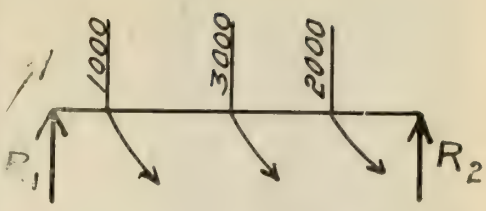

Fig 7

After studying the simple beam it will be found beneficial to determine the values for the shear and bending moments for a cantilever beam uniformly loaded and with concentrated loading. Many of the mechanical handbooks give the fundamental formulae and diagrams for these typical cases. In Mark's handbook under Beams, pages 397 to 401, diagrams and formulae for every general case of loading on beams is given. The student should own a good mechanical handbook for reference, and Mark's latest edition (McGraw Hill Co., New York) is one of the best. He should also have a Cambria or Carnegie steel handbook. Next leson we will take up further considerations regarding beams.

CANADIAN-BUILT PAPER MACHINES

In the Sept. 22nd issue we mentioned the installation of two 166 inch news machines by the Laurentide Co., Limited, Grand 'Mere, Que. These machines were built in Canada by the Dominion Engineering Works, Limited, at Lachine, Que., and represent a record in Canadian Machine building. They were ordered in October, 1919. One machine was installed January 5, 1921, and the other February 2?. 1921. While these machines were being built, the makers rebuilt parts of these other machines and turned out a new 90 inch, four cylinder board machine, and 1418 inch Harper Fourdrinier machine, all of which represent a remarkably good rate of production of special machinery in a new plant. Speeds of 1,000 lineal feet per minutes of paper produced have been reached on kraft paper, but these 166 inch machines are now producing newsprint daily at the rate of 1000 to 1030 feet per minute, and the combined product of the two machines averages 160 tons daily.

Machines for operation at such high speeds must necessarily be equipped with all the latest devices for handling the sheet through the machine and for insuring freedom from breakages and getting practically continuous production. When one considers that under the above conditions, the speed of a 30" diameter couch roll is 127 r.p.m., it is evident that the limit of human skill in handling paper through the machine by hand has been left far distant.

WELDING AND CUTTING

Learning to Weld--Points for Beginners

Preheating is Very Essential—When to Preheat—Table Showing Approximate Temperature Colors—Protecting the Weld—Penetration—Welding Speeds—Testing Welds—Brazing

*By FRED. E. ROGERS

IN the Oct. 6th issue of Canadian Machinery we commenced a lesson on welding. Space did not permit our completing it in that issue, but following is the continuation of the article.

Preheating

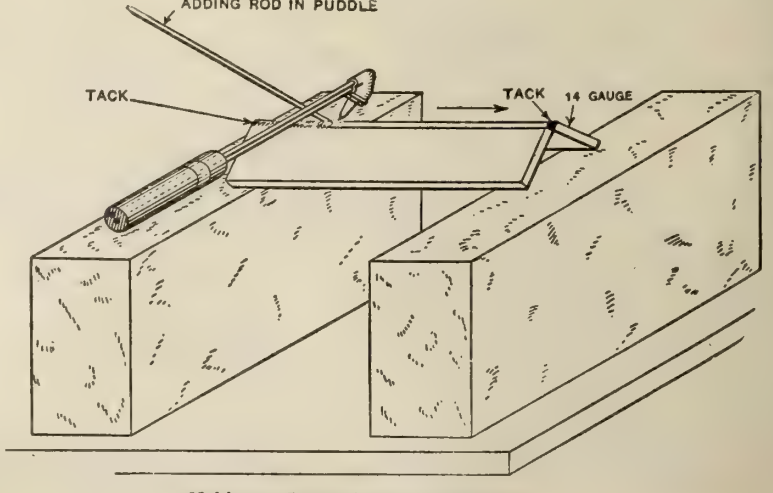
When welding brittle metals like cast iron and aluminum it is necessary to preheat an extended area surrounding the joint before undertaking to weld under conditions where the metal will be unduly stressed by local heating; or to confine the heated area to a narrow zone by cooling with asbestos soaked in water. Preheating may be accomplished in small parts with the welding flame, but it is very wasteful if not impossible to preheat large castings in this manner. Preheating is usually accomplished by means of charcoal or coke fires or by gas or oil burners. The heat should be applied to those parts that will be stressed most by local expansion, and means should be provided to conserve the heat and prevent waste of fuel. It is customary to build crude temporary furnaces of brick or sheet iron around parts to be preheated to confine the flame and direct them where the heat is required. Preheating of stoves and furnaces is desirable when the volume of work warrants the investment.

Temperature Colors, Approximate.

Color	Deg. F.
Faint red visible in dark	750
Faint red	900
Blood red	1050
Dark cherry	1175
Medium cherry	1250
Cherry or full red	1375
Bright red	1550
Salmon	1650
Orange	1725
Lemon	1825
Light yellow	1975
White heat	2200
Bright white heat	2500
Brilliant white heat	2700
Dazzling white heat	2900

*From a book published by the Davis-Bournonville Co., Jersey City, N.J.

The proper location of preheating flame may puzzle the beginner in the welding game, but if he will stop to consider where a wedge driven into the weld would be likely to break the surrounding parts it will not be difficult to decide where the wedging effect will most severely stress the metal. Preheating should be applied to these points. Attention should be given to slender parts that may be slightly bent by expansion stresses. These are likely to break and they should be preheated to increase their flexibility under bending stresses.



The welder should thoroughly appreciate the economy of preheating due to saving the costly welding gases. It is advisable to preheat heavy castings simply to save oxygen and acetylene even though there is no danger of expansion stresses causing fracture. A preheated casting is welded in less time and a sounder job results than if welding is begun with cold metal.

When to Preheat.

The welder of cast iron when in doubt, always preheats, if possible. He thereby insures the casting against breakage in the process of welding, saves gas and insures a sound weld. If trouble is met in getting the metal to flow, when welding a heavy cylinder, the reason almost always is that heat is being absorbed so rapidly that the metal cannot be raised to the fusion point beneath the torch flame. If the welder works long enough and uses sufficient gas he may finally produce a weld, but only at higher cost than if preheated.

If the job is one that must be done in a hurry and the cost is of secondary importance it may, under some circumstances, be done without preheating in the conventional way, but only by using a large tip and burning much gas. Preheating is done, nevertheless, but with acetylene instead of the cheaper coke, charcoal or kerosene. Ordinarily all cast iron work of any importance, especially of considerable thickness, should be preheated to a low red. It will then weld easily and quickly.

It is somewhat difficult to emphasize the importance of preheating cast iron parts without conveying the impression that it should be done invariably. The inexperienced welder should always preheat and only as he gains skill and experience may he undertake the risk of not preheating. In other words, the oxy-

Making a Corner Weld in Thin Steel.

acetylene welder should go through a period when he preheats everything, but the expert welder may, through knowledge and acquired skill, handle jobs successfully without preheating on which the less experienced welder would fail. No two jobs are alike, and set rules cannot be fixed as to what to preheat and what not to preheat. The only rule safely followed is: "When in doubt, preheat."

Castings having closed cored spaces such as piston heads should be handled with caution. Oil may have leaked into these spaces, and if the part is preheated the gas generated and confined may cause an explosion. The first thing to do is remove the core plugs so as to permit gas to escape freely.

Protecting the Weld.

When a weld is completed the torch flame may be swept over it and the parts adjacent several times to equalize internal stresses developed while the weld was being finished. When this is done the weld should be shielded to prevent rapid cooling. Asbestos paper is indispensable in the welding shop for preheating. Vulcanite asbestos is furnished to the trade in rolls, about 36 inches wide, and being easily shaped to any surface it may be used to good advantage when preheating, to take the place of sheet iron or brick. Several thicknesses may be required on large parts, depending on the size and situation.

Great care should be taken after welding heavy cast iron parts to protect the whole casting from drafts and rapid local cooling. Rapid cooling not only is dangerous but it tends to harden the metal if very hot and make it brittle which might be the cause of failure in service.

Penetration.

A common fault of a beginner's welds is "adhesion." When torn apart an adhered weld shows that the weld metal is plastered on and stuck in spots, whereas in a sound or cohered weld the weld metal and parent metal are thoroughly united. For want of a better term "penetration" is used to express thorough knitting or interlocking of a weld. The heat of the flame must "penetrate" and fuse without oxidization, under which condition union should be secured. Adhered welds are produced, for instance, when the operator fails to heat both sides of the joint evenly and fuse them with the welding rod. Often one side of the joint will be found soundly welded while the other side adheres in spots. Correct torch movement which directs the flame squarely upon the metal and heats the adjacent parts evenly to the melting temperature is one of the secrets of sound welding. Hence the importance of learning to handle the torch correctly in the beginning can hardly be overstated. Unless the welder secures penetration and cohesion his work is bound to be faulty. His training should concentrate on this point until he learns to recognize instinctively when the metal is blending under the flame.

Proper Size of Tip and Flame.

So much depends upon selection of tip and size of flame that the injunction is repeated that welders, especially beginners, should be governed by the table of tip numbers furnished with D-B equipment. Success or failure depends on the size of flame and this is governed by thickness of metal up to a certain limit.

If too small a tip for the joint is used the heat radiated will require that the flame must be held at one place so long that the metal will be oxidized before the weld can be accomplished. Furthermore, it will take much longer to make the weld, and require more gases to do the work than if the flame is of the proper size for the job.

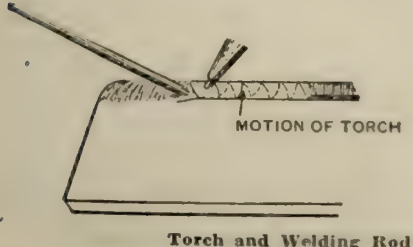
Too large a flame is also objectionable because the operator will not be able to work the torch rapidly enough to place the molten metal before it is overheated. The correct size flame should reduce the metal to the molten condition of a width about equal to the thickness welded. Thus, if the metal is ½ inch thick a No. 6 style 99 tip should be used in D-B style C welding torch, which should fuse a section of metal about ½ inch wide. Of course, the relation is not carried out for very heavy sections but as these are—or should be—preheated, the work of the torch is made easier.

When welding heavy metal be careful not to blow molten metal on to "cold" metal as the result will be adhesions and not welds. Should the metal adhere accidentally the torch should be applied until thorough penetration and cohesion has been effected.

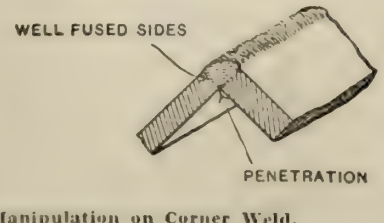
Welding Speeds.

Expert operators have welded steel plate ½ inch thick at the rate of 3 feet per hour, and in some cases higher speeds have been accomplished on even thicker metal. These are not average speeds, however, and in general the welding rate on ½ inch plate may be conservatively put at 1½ feet per hour. When the weld is considerably reinforced, as is the practice of concerns welding tanks and pressure containers, the welding speed may drop to 1¼ feet per hour, or even to an average of about one foot. Steel plates ¼-inch have been welded at the rate of 15 feet per hour. Much higher welding speeds are possible on thin sheets, 30 feet per hour being not unusual for the light weight gauges.

Testing Welds.

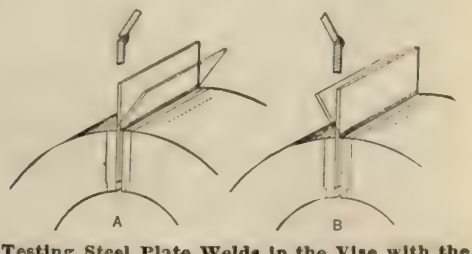


Beginners will learn much by breaking practice welds apart and closely examining the weld structure. They will be surprised to learn how faulty a weld may be that appeared smooth and sound before broken. A simple way of testing is holding in a vise just below the weld and breaking it with blows of a hammer. The presence of trapped oxide and adhesions will be almost invariably shown in first efforts. Repetition will give practice and result in rapid improvement, as the welder then realizes how important it is to follow the approved torch method.



The importance of weld tests can hardly be exaggerated for nothing appears to stimulate the average welder as much as the discovery that his previous efforts produced poor results. The D.B Institute has installed a 100,000-pound Riehle testing machine for pulling test bars apart, and all students are required to weld steel test bars 2 inches wide and ½ inch thick until able to make welds of from 85 to 90 per cent. full strength, without reinforcement.

The vise-and-hammer test is also used to determine bending strength and to disclose defects, especially in the early stages of the course.



The structure of a weld may be made to stand out clearly by sawing across a welded joint, filing or grinding smooth, polishing and etching. Adhesions are thus shown by sharply defined lines between the adding material and the parent metal, whereas a cohered joint shows faintly defined lines and evidence of interlocking. A perfect cast iron weld should show no line between the weld and parent metal when broken but when polished and etched the slight differences in structure generally can be seen plainly.

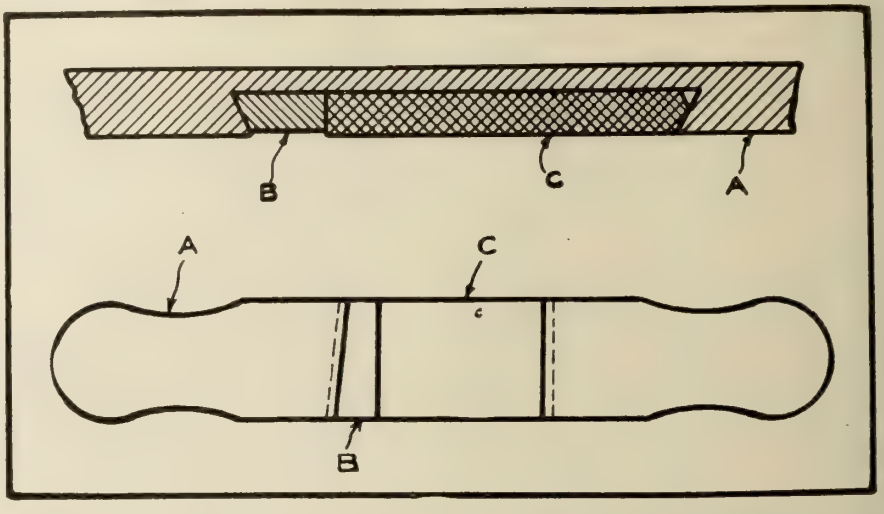
Torch and Welding Rod Manipulation on Corner Weld.

Testing Steel Plate Welds in the Vise with the Weld and Against the Weld.

WHAT OUR READERS THINK AND DO



QUILT STITCHING MACHINE

By J. H. Moore

Gearing has many uses, but how about the maze of gear work shown in the accompanying illustration? At first sight it looks like some sort of a Chinese puzzle, and if the readers were given say three guesses each, it is doubtful if they would arrive at a successful conclusion.

This interesting arrangement of gear ing is used on a specially constructed "Quilt Stitching" machine. It is often a source of wonder to the uninitiated how the stitched pattern on bed quilts is so even, but here is the solution. A small pinion 1½in. diameter, which is fastened to the carriage of the stitching machine, starts its motion from the outside of the gearing arrangement depicted. The carriage to which the pinion is fastened is free to move in either direction, so that once the pinion starts on its journey, the carriage actually travels in a similar manner to that of the pattern of the gearing, in this way completing the stitched pattern on the quilt, as the stitching needle has been running up and down at a rate of 700 strokes per minute all this time.

The following figures will give the readers some conception of the proportions of this gear gauge, as it might be safely termed. The dimensions over all are 4ft. 3in. by 5ft. 3in., and the width at the narrowest portion of pattern is 2in. It is surprising how the pinion goes around such small curves for in many cases the radius on corners is only 2in. The gear teeth are ¾in. face and all teeth are cast. In fact to replace this casting would cost approximately $600. 00. Ten minutes is usually employed in the completing of the journey of the pinion, or in other words, the stitching of pattern on quilt takes about 10 minutes. Armstrong Bros., of Adelaide St. W., Toronto, produced this machine, and it is through their courtesy that we are able to reproduce what we consider a very interesting gear arrangement.

DRAW FILE HOLDER

The sketch shows a simple holder adapted to use up the ends of broken files. This part of a file is seldom used, and the holder as shown was made of ⅜ in. flat stock and was machined across the middle. One side of the slot is at right angles with the edges, while the other is cut at about 5 degrees taper. The taper key B completes the holding portion. The file used is ground on one edge to suit the slot, and of course the handles of the holder are shaped to afford a better grip. Draw filing is easily accomplished with the use of such a holder.

How is this for a mixed mess of gearing?

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Following are the names of those who submitted correct lists in the Sept. 29th contest: George Laud, Peterboro; Ernest V. Bell, Fredericton, N. S.; G. G. Saunders, Carzill, Ont.; and Paul A. Wink, Cobalt, Ont. Mr. Land was the lucky scale winner this week.

CONTEST FOR OCTOBER 20TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1 How to make your job secure.
2 Something that will soon pay for itself.
3 A product that raised a standard.
4 Something said to never leak.
5 An operation recognized as absolutely necessary.
6 Three things which protect.
7 Something that reduces labor costs.
8 A fact worth looking into.
9 Something that does not stop with delivery.
10 A point too often neglected.
11 Something done in two seconds.
12 A pretty strong statement.

These are Correct Answers for List from September 29th Issue

1—Nicholson File Co.
2—Algoma Steel Corporation
3—Wright Mfg. Co.
4—United States Electrical Tool Co.
5—Smooth-On Mfg. Co.
6—Landis Tool Co.
7—Steel Co. of Canada.
8—S. F. Bowser Co.
9—Roelofson Machine & Tool Co.
10—Canadian Link Belt Co.
11—J. C. McLaren Belting Co.
12—Elk Fire Brick Co. of Canada.

Closing Date for This Contest is Nov. 10th

DEVELOPMENTS IN SHOP EQUIPMENT

NEW CHERRYING ATTACHMENT

Several new points in design have been added to the Pratt & Whitney die sinkers to make them more convenient to operate and easier to maintain. The driving spindle has been provided with a positive pin lock in four positions so that the chuck or collet can be tightened without holding the driving belt.

The spindle pulley has a new system of oil grooving opposite to the direction of rotation so that oil is continually carried upward insuring complete lubrication without loss of oil. A floating babbitt washer takes the thrust of the cut on the spindle, a system of oil grooving distributing the lubricant evenly over the entire bearing surface without loss.

The main drive cone has been fitted with a hollow spindle communicating oil holes delivering the oil to a series of felt packed grooves, conserving the lubricant and guaranteeing an ample supply.

To protect the ways from chips and dirt, leather wipers held by cast iron caps are attached to the knee, fitting close to keep all foreign matter out of the knee mechanism. The vise capacity has been increased for larger work and the vise has been strengthened in proportion to this greater capacity. A telescopic elevating screw is now furnished in place of the old type of straight screw that required a hole in the floor to operate in.

The elevating wheel shaft is mounted with a thrust bearing for ease of operation, and the outboard bearings for the knee and vise slides have been straightened to eliminate any chance of breakage and the slides themselves are grooved and protected with covered oilers so that "sticking" in the slides is practically impossible.

NEW SANDER

The Oliver Machinery Co., Grand Rapids, Mich., have marketed a new belt sander known to the trade as No. 126. This machine is suited to sanding and polishing off all kinds of line and edge mouldings, flat and straight surfaces, and for sanding and finishing built up pieces. The polishing of metal can also be performed on the machine.

The table of machine rolls on ball bearings this feature being patented. It is said to be so easy in running that a slight push will run it the full travel of 36 in., consequently it is lighter for the operator in his work. By means of counter shaft to take up the slack of the belt a flexible tension to suit work is maintained. The machine has capacity to take work any length and sand to center of 72 in. It will take work on the table 54 in. high and over floor plate 72 in. high. The table travels 36 in. with a vertical adjustment of 14 in. Sanding belts up to 10 in. wide may be used.

The table top is constructed of plain wood strips with 1 in. gaps between each strip. These gaps allow any dust that may accumulate to drop through keeping the table clean. The table is 32 in. wide by 96 in long and is equipped with an adjustable bar to hold the work to be sanded. The idler is adjustable up or down to height of work and can also be adjusted in a tilting position to keep the sand belt from running to either side of centers. The edging atachment is made to attach o power stand arm and is used for sanding edge work. It is composed of a belt plate adjustable table that can be tilted to 45 degrees up or down and can be raised or lowered at the will of the operator. It also has attachments for sanding form edge mouldings or irregular shapes.

OIL GROOVING MACHINE

The Fischer Machine Co., 310 N. 11th St., Philadelphia, Pa. have marketed an oil-grooving machine which is designed for cutting either straight or helical oil-grooves on the internal surfaces of bearings up to 15 inches in diameter and 15 inches inlength. In appearance, the machine resembles an engine lathe, except that it is provided with a crank mechanism like that of a shaper, which imparts a reciprocating movement to the boring-bar in which the oil-grooving tool is held. The machine combines the standard features of an engine lathe and a crank shaper, and six spindle speeds ranging from 14 to 111 revolutions per minute are available. The swing over the bed is 19 inches, and the net weight of the machine is 3,000 pounds.

Something To Be Proud of

IT IS not generally known that Canada can boast of having two of the highest concrete telegraph poles in the world. These are located near St. Catharines, and are used to carry high-tension power lines over the canal; the great height being necessary to allow mast room for ships passing through. The poles we speak of are placed without guy ropes or braces, which is in itself a point worthy of notice, for even a steel mast of similar height is usually guyed and stayed. The secret of the concrete pole's strength is a very elaborate system of steel rod reinforcing.

In the rush of other matters, we are apt to forget the debt we owe to construction engineers, who by their patience and experimental work have made possible the extensive use of concrete. Think of the huge buildings on which enormous saving has resulted through the use of this material. Think of the construction work happening all over the world at the present moment, using concrete as one of the chief materials. To enumerate all the uses of this material would serve no special purpose, except to prove our previous claim, that the world at large owes a debt to those responsible for the advancement and success of concrete. The process of perfection has taken a considerable length of time, but like any other great achievement, each step has acted as a spur to still greater efforts. Without concrete we should have to go back to the slow and laborious methods of building which have been practically obsolete for many years.

The Reward of Merit

WHEN a man performs a notable deed he is usually presented with some token, to show that his effort, or bravery perhaps, has been appreciated. For example, when someone is rescued from drowning under trying circumstances, the rescuer is often presented with a medal from the Humane Society. The actual value of such a medal is perhaps $1.00 so far as material and work is concerned, but as a token of bravery performed, its value cannot well be spoken of in terms of dollars and cents. Likewise, the Victoria Cross, and other lesser medals presented on the field of battle are small items of value commercially, but are beyond price when considered in the spirit in which they were given, and received.

There are men and women, however, performing deeds of merit every day who do not appear in the public eye. The nurse daily goes about her duty, the doctor likewise handles intricate cases without a murmur, and so it goes. They perform their tasks quietly and efficiently with no other thought of reward than their regular salary. Another phase of industry that is often forgotten is the railroad. Millions of people travel daily on railroads throughout the world, yet seldom give a thought to the responsibility of those handling and operating the traffic. The man at the telegraph key; the engineer at the engine throttle; the operator in the switch cabin; all have their responsible duties to perform, and each must function at the proper time. We could go on indefinetly down the line to the man responsible for the condition of the tracks on which the trains run, but the enumerating of each position would serve no special purpose. The fact remains, that here is a section of industry which deserves great praise.

The true caliber of such men, however, comes out in an emergency. It is then we see whether a man has a quick acting brain, or if he is merely a functioner. The Canadian Pacific Railroad, in fact, many other roads, have the right idea, for to show their men they are watching and appreciating their efforts, they publish at various periods, bulletins covering deeds of both merit and demerit. When a man performs some deed of note he is given so many merit marks, depending on the nature of the act, while he receives demerit marks for careless work. This policy tends to keep the men on edge, as they are naturally very anxious to show their ability. Let us take at random, a merit, and demerit incident.

In a recent report, front trainman Hardy was given 30 merit marks for the following reason. While on a passenger train at night, and with no wire communication, he started to walk to the next telegraph office to report his train in trouble on account of a washout. Noticing a canoe on the shore of Lake Superior, the district in which he was operating, he secured permission of owner, and used the canoe across Jack Fish Bay, this action saving considerable time.

Let us next pass to the demerit story. A certain car checker received 10 demerit marks for throwing a melon skin on the switchboard in a telegraph office window, this resulting in wire trouble.

Having quoted the two stories let us see where these men stand. The first fellow Hardy was not only on his job, but was thinking of protecting his passengers. The car checker on the other hand was not thinking of his job otherwise the melon skin would not have been in his hand during working hours. The act of throwing the skin is so foolish in itself that we need not make further comment. To place an actual value on announcements of this nature is rather difficult. It may mean a slight increase in salary occasionally, but each item in itself has no commercial significance. The true value lies in the fact that the publishing of such stories is a sign these men are either making or marring the safety of railroads. The reward of merit cannot be reckoned in currency and the correct type of man desires well merited praise rather than money for the performance of such acts.

The practice of publishing such lists of merit is one to be highly commended, and we could well adopt the idea to our own line of industry, the machine tool trade. If a man prevents an accident, or reduces the time on some particular operation, he should be credited with so many merit marks, while on the other hand if he is careless and spoils unnecessary work; causes accidents, or gets hurt himself through neglect, he should have so many demerit marks chaulked up against him. Let us start a movement in this direction, and through time it may develop into another means of reducing the accident toll.

MARKET DEVELOPMENTS

Reports from Different Markets Vary this Week

Galvanized Sheets Go Up in Price—Sheets and Plates for Car Work, etc., Move Freely—Machine Tool Market Dull—Steel Ingot Production on Upgrade—Finished Steel Prices Stiffening

THE REPORTS from the various markets this week are rather conflicting. Take Pittsburgh for example. They te l us that the improvement in the iron and steel situation continues, and that although the steel trade has a very rough road to travel before it reaches normal, still it is far from being in a bad state. In fact they say there is no reason to complan.

In the Pittsburgh market letter is shown an increase in the production of steel ingots, also a stiffening of prices in finished steel products, bar, shapes, sheets, and plates, being foremost in this respect. The recent freight reduction on iron ore has thrown a damper on the pig iron market, but such a condition is not expected to last long.

Montreal says that general trade conditions have more than held their own during the past week. A stronger tone has made itself felt and jobbers, dealers, and manufacturers are more hopeful than formerly. There is a possibility that the government will place additional orders for rolling, so that the mills will be able to keep going through the winter. Sheets and plates for car work, tank work, etc., are moving very freely in ths field.

Both in the Toronto and Montreal markets, there is a lull in the demand for machine tools. This week seems to be worse than the one previous, and about the only thing that is selling is second hand tools. Many dealers have good prospects on hand, which they believe are brought up to the buying point, but so far no business of importance has been closed.

The small tool market is just about the same this week. One notable point is that orders are coming in from all over. This shows that a general activity is being felt, not merely a local spurt. The fact that many orders received are from very small towns proves this theory.

The scrap meta' market is at a standstill. Nobody wants to buy. Even the dealers themselves refuse to stock up further, and from present outlook no improvement is in sight.

IMPROVEMENT IN IRON AND STEEL STEEL INGOT PRODUCTION INCREASES

Special to CANADIAN MACHINERY.

PITTSBURGH, October 20.—The improvement in the iron and steel situation that has been practically continuous since the middle of July is not interrupted, but in some quarters there is disappointment that the gains in the past few weeks, since the midsummer period ended, have not been more rapid. The proportionate gains, however, have not been bad at all. The steel trade had a very long road to travel from the state of extreme depression, altogether unprecedented in extent, that prevailed last June and July, and the fact that the trade is still very far from a condition of reasonable activity is due to the distance to be covered being large, not to the rate of recovery being particularly low.

Production Rates

Demand for steel is measured by production rates, since with exceptions that are almost insignificant from the tonnage standpoint, buyers are ordering steel only against actual requirements and the steel is being produced and shipped practically as fast as ordered. One exception is that buyers of sheets were moved to stock up a little by last month's advance in price, buyers being permitted to cover at the old prices if they would furnish actual orders and specifications (not contracts) and accept deliveries as rapidly as the mills cared to make them.

The monthly report of the American Iron and Steel Institute indicates that steel ingots were produced in September at the rate of about 17,000,000 gross tons a year, or 32 per cent. of capacity, against rates of 30 per cent. in August and 21 per cent. in July, while the rate at the middle of July was about 19 per cent.

Production of ingots thus far this month has been at above the September rate. Last week the Steel Corporation produced at the rate of about 40 per cent. and the week before that, the week ended October 8th, at over 45 per cent., but that was a particular bulge, the departments scheduled for operation producing considerably more tonnage than had been expected in the scheduling. Probably the independents did not operate nearly as well, but it seems safe to forecast that the October ingot production will prove to have been at above 35 per cent. of capacity, when the regular report is made early next month. That would represent a fair gain over the September rate, and would be nearly double the rate at the low point, in the fore part of July. Such a recovery is really rather rapid, and the disappointment felt in some quarters just now may properly be ascribed to unreasonable impatience.

An important point is that all the appearances indicate that whatever gains the steel industry makes at this time will be permanent. There is no overproduction or overstocking, and actual ultimate consumption is bound to increase rather than decrease, while production for several months past has obviously been at less than the rate of consumption, since there has been liquidation of stocks of steel in the hands of buyers, and of stocks of manufactures of steel in the hands of manufacturing consumers and distributors.

Price Conditions

On the whole, the structure of finished steel prices is tending to stiffen. This stiffening is not attributable to the usual influence, of demand exceeding supplies, for in every branch of the finished steel trade there is surplus capacity, but is due to the mills trying to get prices to a level with production costs. It may be asked why mills do this when they allowed prices to decline as they did, when costs were higher than they are now. The answer given in some well informed quarters is that the mills were endeavoring to find a level at which buyers would take hold freely. They considered losses as of secondary importance if by taking losses for a time they could produce a large increase in steel consumption and get things go-

ing again. It may have looked, in June and July, as if there was simply competition, perhaps unreasonable competition, but there was method in the price tactics after all. The whole country was calling for "liquidation" in prices, and early in the year the steel industry had been criticized in not a few quarters for standing in the way of progress, for refusing to deflate. Then the steel industry "came back" at its critics. There can be no argument about this, for price comparisons make a plain showing. The Department of Labor's index numbers of commodity prices at wholesale are generally accepted as indicative. The department takes average prices in 1913 as 100 and then finds that July prices stood at 148 while in August the index number came out at 152, showing a slight upward reaction and indicating that price liquidation, in general, had come to a halt. Now as to finished steel, a weighted average of the representative products, bars, shapes, plates, wire, pipe, sheets and tin plate, at the recent low point (before the September advances in wire and sheets) shows an index number, based on the 1913 average, of 135, which is well below 152 or 148.

This stiffening tendency in steel prices is most marked at present in bars, shapes and plates. Since early in August there have been sellers of all three products at about 1.60c, if the order were fairly attractive, but the number of sellers at this level has been decreasing. A fortnight or more ago the Carnegie Steel Company firmed up to 1.65c on bars and 1.75c on shapes and plates. Several independents are on that basis. The sellers at lower figures are not unlikely to withdraw their lower prices almost any day. They are not trying to fill up completely but would like to get something like a fair order book.

In sheets there is also what may be called a stiffening tendency. In fact, the majority of independents have already announced a $5 a ton advance, making their asking prices 2.50c on blue annealed, 3.25c on black and 4.25c on galvanized. The object, of course, was to drive in orders at former prices, which represented an advance of $5 a ton over prices prevailing in the fore part of September. In wire products, on the other hand, there have been occasional sales in the past ten days at prices prevailing before the advance of September 12, that advance having been from 2.50c to 2.60c in plain wire and from $2.75 to $2.90 in wire nails.

Pig Iron and Coke

As was to be expected, the announcement of a 28 per cent. reduction in iron ore frieght rates, referred to in this report of a week ago, has cast somewhat of a damper on the pig iron market. The reduction, effective October 20, restores the iron ore rates in effect prior to August 26, 1920, but as the furnaces have large piles of ore in yard they do not save anything at present, and cannot "pass on the reduction" to pig iron buyers. If they were disposed to do so, pig iron buyers would naturally prefer to wait so that prospective reductions in coke and limestone rates could also be passed on, while they would also like to wait until rates on pig iron from furnaces reduced. The market has been quiet in the past week and is quotable at former prices, $20 for Bessemer, $19.25 to $20 for basic and $21 for foundry, f.o.b. valley furnaces. The freight to Pittsburgh is $1.96. In 1914 it was 90 cents and in 1901 it was 75 cents.

The Connellsville coke market has softened in tone in the past ten days. Minimum prices are hardly any lower, but expectations of an advance, based on the lower priced offerings being absorbed and taken out of the situation, have been dispelled. Prompt furnace coke is $3.35 to $3.50, fourth quarter contract coke $3.40 to $3.50 and prompt foundry coke $4.25 to $4.75, depending on brand. It is only decidedly indifferent quality coke that can be had at $4.25.

POINTS IN WEEK'S MARKETING NOTES

The railways have not yet come into the market for steel, machine tools or supplies to any great extent. There is a possibility however that orders for rails will be placed with concerns in Eastern Canada in order that the mills may be kept running during the winter.

Sheets and plates for car work, tank work, containers, etc., continue to move very freely.

The machine tool market in Montreal and Toronto is rather dull, and what demand does exist seems to be for second hand tools. There is a tendency to study prevailing designs, improving on the various types as much as possible.

Steel ingot production is on the upgrade, the rate varying from 32 to 45 per cent. However about 35 per cent. would be a better average to take. The production last July was only 19 per cent. so this is quite an increase since that time.

Finished steel prices are stiffening, bars, shapes, sheets and plates being foremost in this respect. The Toronto market shows an increase in price on galvanized sheets this week, the boost being equal to 25 cents per 100 lbs.

The coke market has softened somewhat during the past ten days.

Machine tools are not very active these days. It's the old story of lots of prospects, but no actual buyers. Various dealers have even tested the market for signs of faith, but have been so far unsuccessful in landing a good sized order.

Small tools are still selling at a fair rate, the orders coming in from quite a scattered territory. This would point out that while business is not rushing, the activity seems to be general rather than local.

The pig iron market is nothing to boast of. Nobody wants to buy, this applying to both dealer and consumer. A change from the better in this market is not yet in sight.

TORONTO MARKET IS SPOTTY THIS WEEK

TORONTO, OCT. 20th.—To describe the market this week is very difficult, for, in practically every line there is a difference of opinion, even among the dealers themselves. Conditions can safely be termed spotty, and while one dealer may be feeling quite optimistic, another may be filled with a pessimistic grouch. For example, a dealer in machine tools told us that September had been the best month he had experienced this year, while another man in the same line said this was the poorest wek he ever hoped to pass through. This condition holds good in practically every section.

The Steel Market.

The only item of importance in this market is the advance on galvanized sheets which went into effect on the 14th. This increase was not expected until the 5th, but as one dealer put it, a day more or less makes no difference these days. The increase in price amounts to 25 cents per 100 lbs., and the reason given for the step up is that makers are trying to get at least production costs out of their product. Dealers claim that the costs of sheets, dropped quite a bit below actual cost of production, and that this, the second increase within a short time, brings the price to a more reasonable level. Apart from this, the steel market holds nothing of importance. There are the usual orders dropping in from day to day, but structural material seems to have eased off somewhat this past week. There is no other change in prices.

Machine Tools.

The machine tool market this week is not very good. Enquiries are not quite so numerous, and some dealers claim that the coming election is indirectly responsible for the lull. There is a tendency to shade prices, which is not going to improve matters much, and dealers would be well advised to quote a price, then stick to it. While orders are few and far between, there are some very interesting prospects being worked up. One dealer says that if he closes up even half his present prospects, it will more than carry him over the past few months, which have been very poor. The average dealer is not at all pessimistic, that is, not all the time. He may have his black moments but when he settles down calmly, he cannot help but admit that business generally is on the upgrade.

Small Tools.

If every section of the market was as steady as the small tool department, all would be well. Orders continue to arrive steadily, and the best part of it is

that these orders are coming in from a well scattered territory. As one dealer said, "This proves that the activity going on is general, not merely local." Through time these orders will become heavier, so that small tool dealers are not worrying much.

Scrap Metal.

The scrap metal situation is still very unsatisfactory. One dealer describes the trouble in this fashion. "Consumers have made up their minds that prices are coming down still further. We, as dealers, know that such is not the case, and as we are pretty well stocked up we refuse to buy further. In other words, both dealer and consumer are out of the market. We will suppose a customer came in right now, and offered to buy a considerable amount of material at present prices. If the order was exceptionally large it is questionable if we would sell him at present rates, but instead, we would offer him a limited quantity at the existing market figures. This procedure would no doubt surprise him, "but in my opinion," finished this dealer, "the consumer can purchase old material for less at the present time than he will be able to do for the next five years. While we would like business, we are not going out of our way to get it at present prices."

We have quoted this conversation in order that readers can form their own conclusions, and while no definite announcement of future price or policy was given us, it looks as if there is more to the scrap market than appears on the surface.

Taken as a whole the various markets cannot well complain. It will take time for the various sections to become settled and as we see it, there is still a considerable journey ahead. The market will see its ups and downs but from now on the downward move will be very much in the minority.

STRONGER TONE SHOWN ON MARKET WINTER RAIL ORDERS MAY BE PLACED

Special to CANADIAN MACHINERY.

MONTREAL, OCT. 20th. — General trade conditions have more than held their own during the past week. The stronger tone, shown more particularly the last two weeks, is still present, and jobbers, dealers, and manufacturers are alike very hopeful, as there seems to be a feeling that good business is in sight. The elections, of course, are tending to put a damper on the natural development of many business schemes. Thus if the slight improvement, noted during the past six weeks continues, or even if present conditions are maintained until after elections, general conditions would be very satisfactory. In short, business throughout the country is discernible, but elections are only temporarily holding matters up. The steel industry is on a fairly good basis.

The railways have not yet come into the market for steel, machine tools, or supplies to any great extent. Other large industrial plants have deferred coming into the market for supplies or equipment. But these corporations are apparently making plans for next year and are arranging a manufacturing schedule. This is evidenced by the larger number of enquiries and the increasing amount of business actually closed in various lines. Everything considered, conditions have greatly improved since midsummer and in some cases are much better than was expected.

Steel Market.

The principal rolling activities in Canadian mills at present consist in rail production. Prices prevailing are fairly good, but represent only a slight profit. At present the Government is considering some additional purchases which were not scheduled to be placed till 1922, owing to representations made by Eastern municipalities in the neighborhood of the Dominion Iron and Steel plants. These purchases, no doubt, will be split between the Algoma Steel and the Dominion Iron and Steel plants. Sheets and plates for car work, tank work, containers, etc., continue to move very freely. These orders cannot be definitely assigned to one or two channels, but evidently the steel which is being delivered on a large number of small orders is eventually finding its way into a large number of widely diversified articles.

One large jobber in steel, stated that up to the present, October has been by far the best month this year. The confidence of the consumer is maintained and everything points to a future with an ever-increasing volume of business. He made the comparison of "business" to a "sick man," who has recently become convalescent and that although no marked or specific improvement could be noted, general progress was good and the "pulse" of the "patient" is strong.

Pig Iron.

The demand for pig iron this week is lighter than the previous week. The price has been firm and an increase is expected. Ten days ago the furnaces notified their sales offices that an advance in price must be anticipated, but so far the advance has not taken place. However, it is expected at any time. The condition of the trade is such that no new furnaces are likely to go into blast, hence the low production continues. No encouraging reports have been received from the foundries.

There is a spirit of optimism, however, existing among foundrymen and if this improvement becomes permanent it will have its re-action in the additional demand for pig iron.

Machine Tools.

The general conditions which govern the machine tool market at the present time are really national in scope, and from week to week only nominal changes can occur. Reports from various dealers are not in accord. One dealer says that September was the best month since May, but that October is falling back somewhat. Another dealer states that business is very quiet. Other dealers, who handle supplies as well as tools, report a very fair volume of this class of trade. Second hand tools are more in demand than new tools. In fact new tools have been rarely moved during the last few months. A general tendency exists to reduce prices, thus getting machine tools down to a lower level than has been prevailing, although nothing definite has been done in this respect. There is also a determined effort to improve the design.

Small Tools and Supplies.

Reports from various dealers in the above market give one a very confused idea as to the real condition in this field of business. Some dealers say that not only is there an increase in the number of enquiries, but an increase in the number of orders, some of these from buyers who have been out of the market for some time. The quantities specified seem to be larger and a generally satisfactory condition exists. Other dealers report business poor and very quiet. The balance issue statements between these two extremes. Prices are gradually becoming staple and price lists are again being referred to with some security. Business is scattered, however, and an analysis of it conveys but little information other than that conditions of the last few weeks show an improvement over that of the last few months.

Non-Ferrous Metals.

Copper seems to be the most active of these metals. Up till about a week ago quotations were being daily increased by about ⅛ of a cent. This stiffening in price has continued during the present week until a re-action in the London market occurred. The latter part of the week the British quotations were down one pound per ton. This was reflected in New York markets by tending to check the upward trend of prices. Business has been somewhat better in this market during the last ten days. The market appears staple and prospects for the continued improvement are good. However, with non-ferrous metals there is a certain speculative tendency that sometimes upsets all calculations in the nature of a forecast. No special features during the week were noted. Awaiting the more active operations of the foundries, the scrap market still continues to be very quiet. Practically no sales are reported and prospects are not encouraging for the winter months.

In a recent address before the members of the building contractors' at Hamilton, Ont., G. Gander, of Toronto, said that the revival of the industry depended largely on the co-operation of the various crafts engaged. He looked for an early revival and predicted that the industry would soon become active, as times, he believed, were gradually improving all the time.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

Toronto, Ont.—About half the usual staff of the Massey-Harris Co. went back to work a few days ago to fill a foreign order. Nothing definite is stated as to future prospects.

The Durant Motors Inc. are said to be considering locating a unit of the Durant chain of factories in Montreal. Nothing definite in this regard is settled as yet. The Toronto plant will be in the market shortly for a limited amount of equipment according to information received.

The Toronto Harbor Commission have given an option on ten acres of property at $60,000 an acre. The type of industry which proposes locating in Toronto is so far a secret although the very location chosen leads one to believe the new plant will be engaged in the metal working field.

Mechanical Leathers, Ltd., 126 Garden Avenue, Toronto, are moving on October 20th, to the Empire Building (3rd floor) 64 Wellington St. W.

Tube and Pipe Bending Co., 65 St. Nicholas St., Toronto, expect to make a sale of their machine to Page Hersey and may be in the market later for a new one, which would have to be made from their own blueprints.

W. H. Banfield & Sons, 372 Pape Ave., Toronto, report business in their line as very good. They have just taken on 15 more men and are expecting some nice orders shortly.

The E. T. Woodison, Co., Ltd., Toronto report business as showing a definite upward trend and expect great things from November. They look for good business in the east from their new Montreal warehouse.

Belleville, Ont.—The Springer Lock Mfg. Co. are erecting a large eddition to their present plant.

St. Catherines, Ont.—J. Birchall who was formerly superintendent of McKinnon Columbus Chorn Co., and McKinnon Industries Ltd., has formed a company at 114 Queenston St., to be known as the United Chain & Mfg. Co.. They will manufacture tire chains and automobile parts.

Woodstock, Ont.—The Kirch Mfg. Co. Sturgis Mich., have located a branch factory here. They manufacture curtain rods and other articles used in draping of windows.

Chatham, Ont.—The Weaver Canadian Co., has been formed in Chatham by the parent American Co. and certain property has been purchased which will be used for factory purposes.

Chatham, Ont.—Fuel oil is now being used with success at the Corhill Bros. brick plant. The new burner used is the result of seven year experimenting and a combination of steam and fuel oil is employed. The bricks produced are said to be of a more uniform quality.

Calgary, Alta.—A permit has been issued to Maclin Motors for the erection of a garage on the south side of Eleventh Ave., the cost to be around $24,000.

The Feldspar Glass Co., Ltd., intend building a factory at Oshawa, Ont. This new plant will be built in units, the first to be 60ftx160ft. They will manufacture high grade glass and by-products and expect to be in operation in a few months. 50 men will be employed to start with but the staff will be enlarged as the plant increases.

Stanley F. Jacob, R. R. No. 3, Tillsonburg, Ont., wants to purchase the following equipment. One lathe and one drill press. He does not state what size, but those interested can soon find out by getting in touch with Mr. Jacob's.

The Ontario Diamond Drilling Co. of Sudbury, Ont., has been incorporated with $40,000 capital to manufacture diamond drills and other machinery. Thos. H. Hale: Albert Carlson and Geo. M. Miller are the men interested.

The Eastern Townships Smelting and Refining Co., which has been incorporated with a capitalization of $2,000,000 has obtained opinions on certain sites in Sherbrooke, Que., and it is said that construction is expected to start in the near future. According to reports, arrangements have been made for the smelters to handle the output of several of the largest producing properties in the west, special attention being paid to copper and asbestos.

The monthly tonnage report of the United States Steel Corporation, made public a few days ago shows 4,560,670 tons of unfilled orders on hand September 30th. This is an increase from unfilled orders on August 31st, which were 4,531,926 tons. This is the first increase in unfilled tonnage since July 1920.

Robt. Gardner & Sons Limited of Montreal, report business excellent. Mr. Braidwood, general manager for the above firm, informed this paper that orders are continuing to pour in, and they will be unable to give delivery on new business till February. All indications point to this being their biggest year since entering business.

Montreal, Que.—J. E. Wilder has been awarded the contract for the erection of a six-storey fireproof garage at the corner of Ontario and Jeanne Mance Sts. for the Bramson Auto Service Ltd. Reinforced concrete will be used in the construction of this garage.

The Brown Boggs Co. Ltd. of Hamilton report 9,000 sales during the past two weeks. Mr. Lavery the sales manager, informed this paper that they expect a steady increase in sales from now on.

The Kingdon Smith Co., Hamilton report a lull in general repair work, but increased activity in contracting. Several substantial orders have materialized recently.

F. Sloley, of the Hans Renold of Canada Ltd., reports that Mr. Hans Renold and his son have been touring the United States with the object of establishing an American agency. A charter has been issued, and this concern have incorporated with a capital of $25,000. C. C. Renold; J. R. Cantley; F. Cunningham Jr.; and Attorney Steel and others are the gentlemen interested. Mr. Sloley says that his Canadian business is moving along nicely and that he has no reason to complain.

Clare Bros. & Co. Preston, Ont. say that they are having a large demand for castings. This firm is busy at present making castings for theatre seats. They are also producing school and office furniture castings and say that they expect to get some passenger car work in the near future. They fully expect to keep their foundry running full blast all winter.

Norman C. Butterfield & Son, claim to have discovered a very large tract of almost pure iron. This discovery lies on the shores of Lake Athabasca. Analysis shows that the new find is 64.36 pure iron. It is said that 150,000,000 tons have been measured off, while 5,000,000 tons in the shape of loose blocks are lying on the surface of the ground ready for shipment. So far freight charges seem to be the chief difficulty.

The American Bushings Corporation, of Marysville, Michigan, a subsidiary of the Pressed Metals Co., of Canada, reports the receipt of orders which will insure the immediate doubling of production of the American plant. October production will run to 1,300,000 bushings, while the November schedule calls for 1,500,000. The officers of the company are hopeful for a continuation of the present active and profitable period. The American company last May with orders totaling 300,000 bushings per month, was increased to 500,000 in the next month, and there has been a steady increase in production since.

Preparations are under way for the third annual gathering of "School" men which will be held in Toronto on the 4th and 5th of November. Arrangements, this year, are being made on a much larger scale than in previous years and it is expected that among the long list of distinguished guests will be one or two of International reputation. Graduates are coming from all parts of Canada and the United States and it is expected that upwards of one thousand will attend the Reunion. At the Annual Meeting board questions relative to Uuiversity Policy, Technical Education and professional matters will be discussed.

It is reported that 200 men will be back to work at the Goodyear Tire and Rubber Co. plant, situated at New Toronto, Ontario, commencing about October 20th. The surrounding districts also report that a substantial amount of building is being done and an industrial activity is being created in that district.

The Allatt Machine & Tool Co., formerly situated at 109 Adelaide St. W. have transferred their office and equipment to 201 Queen St. E. Toronto. Mr. Allatt states that although business is not rushing with him he has a constant amount of work regularly passing through his shop especially in the lines of cylinder regrinding. He further stated that he expected that his business would increase this next month.

The Town of Georgetown, Ontario, is calling for tenders on a water system to include construction of reservoir, pump house, screen chamber, weir, mains, ditches, etc. Tenders are also asked for pumping machinery, two units of 400 gal. capacity each. All tenders to be in not later than Oct. 28th. Chipman and Rowers, Mail Bldg. Toronto are the engineers in charge.

While no contracts have as yet been awarded it is generally believed that the Federal Government will shortly let the balance of the Welland Canal Job in order to provide employment this fall and winter.

On Oct. 13th., at the C. P. R. Windsor St. Restaurant, the Engineering Institute of Canada, Montreal Branch, entertained six of their members, who were, later in the day, to have the Honourary Degree of Doctor of Laws conferred upon them by McGill University. The names of the gentlemen, who are well known to the readers of Canadian Machinery, are:—

W. W. Colpitts, New York City, Consulting Engineer; C. V. Corless, Sudbury, of the Mond Nickel Co. Ltd.; G. H. Duggan, Montreal, General Manager of the Dominion Bridge Co. Ltd.; Phelps Johnson, Montreal, Associate Engineer for the Quebec Bridge; Alexander MacPhail, Kingston Professor of Engineering, Queen's University; G. F. Porter, Walkerville, Associate Engineer, Quebec Bridge. The speeches were largely references to the advancement of Engineering in the last quarter of a century and its importance as one of the basic factors upon which modern civilization is built and sustained.

The Jenssen Engineering Products, Ltd., is the name of the new firm which has absorbed the Power Equipment and Supply Company. The offices of the new Company are in the Power Building, Craig St. West, Montreal. Four Engineering specialists comprise the personnel of the firm, L. N. Jenssen, J. C. Corcaran, F. W. Ward and J. A. Smith. The firm was organized as a body of consulting engineers who undertake to analyze practically all industrial problems; make recommendations and supply materials, machinery, equipment, buildings, etc. They specialize in pulp and paper development, hydro electric development, coal handling plants, grain elevators, manufacturing plants and in fact, practically all industrial lines with the exception of the textile industry. They also go into the design and supplying of special equipment, as well as standard lines. They are prepared to design and erect complete plants, and to make a scientific study of plants in operation with the idea of reducing overhead manufacturing costs.

The Eugene F. Phillips Electrical Works, Ltd., have arranged to remove from Montreal and locate in Brockville, Ontario. The reason for the change is said to be because of congestion in the Montreal plant, business having increased to such an extent that the Montreal factory has long since been outgrown. An agreement has been made whereby the company is to be granted a site of 132 acres and to have a fixed assessment of $20,000 for ten years. In turn the company agrees to locate its main manufacturing plant in Brockville, which will include the erection of buildings costing between $2,500,000 and $3,000,000, to give employment in normal times to between 500 and 600 hands and to distribute an estimated annual payroll of $500,000. The products of this concern are copper, electric wire, and cable, and in the manufacturing process they will require from 1,000 to 3,000 horse-power which will be obtained from the Hydro-Electric Power Commission. The consumption of this amount of power will cut in two the rate of other local consumers of power in Brockville. Work will be commenced on the first unit of the plant within four months, this being a rolling mill for the copper products.

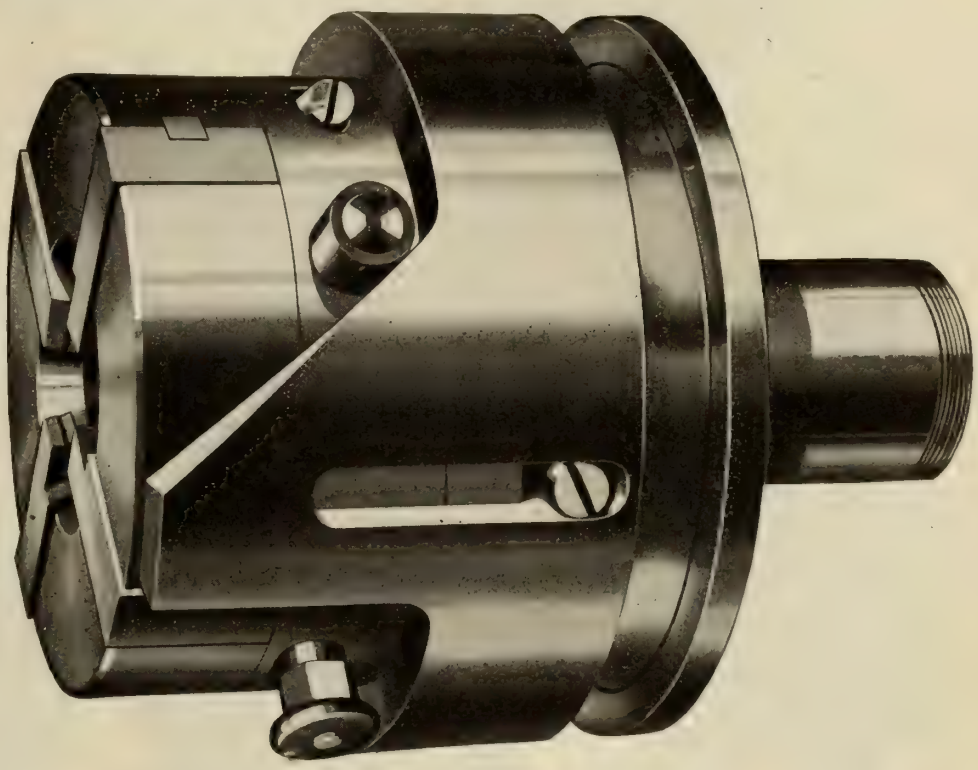
The Canada Glue Co. Brantford, report some improvement in general conditions. This is significant in view of the fact that glue is produced to day in more different grades and qualities than the lowly and long-suffering pickle, and has contact with many industries. While at first glance one would say that furniture and allied trades form the essential market for glue as it is generally known, this is not altogether the case. Certain grades are used in the textile and paper industries; in making emery wheels and other abrasives for metal and woodworking, for hats, and boots and shoes and wherever there is sticking or sizing to be done. Glue, like the safety pin, has a wide range in usefulness, and it is important when an improvement is noted in its demand.

In going out of the horse vehicle business to devote his entire plant to the production of motor cars, an Ontario manufacturer points out that in selling buggies to farmers over a long term of years only ten per cent. is paid in cash, while the great majority usually took two annual payments. On the other hand, in purchasing a motor car, seventy-five per cent. of the farmers plank down the cash, while the remainder is credit. The life of a motor car, as used by the average farmer, is about six years, while a good buggy easily lasted twenty years. It was about five years ago that the credit system was introduced in the motor sales business and while the idea made for greater volume it has not eliminated any of the troubles of the business. It is estimated that in an average county having no exceptionally large centre of population, there are on an average, 2,000 cars being paid for on credit.

W. R. Yendall, Manager Canadian Richards Wilcox, London, has returned from a business trip in the West. He reports that conditions in British Columbia are better than he expected. Greater activity in building is evident there than in the East. In the prairie provinces the deflation in wheat prices has been discouraging and anticipating a rise, farmers stopped hauling grain for a while. As seems customary under such conditions, payments are somewhat backward. The political campaign is assuming some importance, reports from rural communities indicating marked development in strength of organizations in the farmers' interests. It is generally felt that there will be marked improvement in alll business with the coming Spring.

A very creditable Made-in-Hespeler exhibition was held in Hespeler this last week. The displays included furniture stoves, furnaces, plumbers; boilermakers; machinists; and blacksmiths' tools, stamped and enamel ware, textiles, lightning rod equipment—and naturally a baby show.

Ordered By The Million



That's the way Studs for Automobiles are ordered from the Chapman Service Company. An order for one million Studs at one time is no novelty to these people, who specialize on Automobile Studs.

They Have To Get Quick Production Without Waste

How Do They Do It?

Geometric 9-16-inch Rotary Die Heads are the means they use for cutting ½-inch diameter, 20-pitch thread on alloy steel studs.

A Geometric Rotary Die Head Self-Opening and Adjustable

Tested for accuracy, there were only nine rejections out of 4,500 Studs, threaded at both ends.

WELL, THEY ARE GEOMETRIC DIE HEADS—
THAT TELLS THE STORY OF THEIR WORTH.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN CONNECTICUT

Canadian Agents:
Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Toronto, St. John, N.B., Halifax, N.

In a Frame Building, 24 x 36 feet, A. B. Jardine & Co., Limited, Hespeler, had its origin 50 years ago. In fact the firm may be said to be in the first years of its second half century, for the founder, A. B. Jardine, began operations in 1870, though he did not go into the production of blacksmiths' tools until one year later. The business is today carried on by his four sons, James, President; Peter, Vice-president: Andrew, general manager, and John, secretary treasurer. At the Made-in-Hespeler exhibition last week, the display of products made by this firm probably occupied a space larger than that in which Jardine, the elder, began operations. And what surprise would be his if he could see the extent of the display, representing the development that has occurred in that time? His original intention had been to manufacture shuttles and other accessories for the spinning trade, but he realized in time that he could not hope to compete with English firms who had been many years in the business. Woodworking machinery claimed his attention for a while, but finally blacksmiths' tools became his specialty.

In those days there were probably ten blacksmiths where to-day there is one blacksmith and two public garages, and as a rule the maker of tools had also to get out and sell them. The years brought their changes both in methods of manufacture and selling and to-day the Jardine line embraces machinists', blacksmiths', boiler makers' and pipe fitters' tools and equipment, and the Canadian market has become considerably larger than that which could be comprehended by horse power days of fifty years ago—days of that more personal contact which is now represented to a larger extent by definite standards of quality.

Munition demands of the great war found the Jardine plant particularly well equipped for the production of shells. As manufacturers of taps, dies, and other precision machinery the exacting requirements of the emergency were soon met and a satisfactory output was maintained.

Asked what in his opinion had been the secret of their development in their business, John Jardine replied: "Secret? There is no secret. Quality is not a secret. It is an ambition. There you have the whole thing in a nutshell. That, and confidence in the line you are manufacturing. But you can't have one without the other."

The Canadian Detroit Twist Drill Co., Walkerville, has completed its initial year as a Canadian Industry. The infant has developed nicely in the matter of organization not only of its plant, but also in its relation to the Canadian market. Some particular attention has been devoted to the production of the Double-D rolled drill, developed for use on such work as hard drop forgings, cased steel castings and other alloy steels tough and difficult to drill. The tool is the perfection of 30 years' development. The high speed steel stock used in this drill is a high tungsten, high chrome steel, subject to careful chemical analysis before acceptance. A special hot rolled process is employed by which the flute of drill is formed in straight from the bar stock and which, it is claimed, produces a refinement and uniformity of the grain of the steel and gives a compression at the outer edge and in center which, after the drill is hot twisted in the final form, brings that portion of the steel, which is best adapted for unusual service, to the vital parts of the drill—the center and outer edges. At the same time the thickness has that uniform increase which is obtained in high grade drills of the milled type—a feature not secured in drills made from profile stock. The fluted blank is then reheated and twisted in a specially designed automatic machine, thus avoiding the inaccuracies of hand twisted drills. The graduated thickness of the web from the point to the end of the twist provides unusual strength of high torsional mixture.

A Few Days Ago a generator under test at the Canadian General Electric Co., Peterboro, Ont., exploded, causing considerable damage, and one death. Since that time the matter has been gone into carefully and an official estimate places the damage at about $150,000. The generator, valued at over $50,0000, is wrecked, a number of other generators being built in its vicinity are seriously damaged, and several machines and the instruments and records of the test department are destroyed. The generator, engineers say, was being operated at 100 per cent. over speed, about 1,000 revolutions a minute, when the accident occurred. This means that a given point on the rotor was travelling at the rate of about four miles a minute.

Robt. Gardner & Co., one of the large general machinist concerns in Montreal, are fairly busy and have orders enough on hand to keep them going until February.

Standard Machinery and Supply Co., Montreal, who are dealers and agents in machine tools, etc., report that September is the best month they have had this year, although the volume of business for that month was not in itself large.

Ingersoll Rand Co., of Montreal and Sherbrooke, Que., who are not doing anything at their plant yet, and who are selling accumulated stock, report that September was the best month they have had this year and present indications with them are such that they are feeling a good deal more optimistic than they have for some time past.

PERSONAL

G. T. Milne has recently returned to Great Britain from South Africa, where he acted temporarily as senior trade commissioner for Great Britain, for Canada and Newfoundland. He will leave London on Oct. 19th to take up his new duties.

John R. Shaw, vice-president of the Canadian Linderman Co. Woodstock, Ont., has been selected vice-president of the newly incorporated Canadian Austin Machinery Ltd. Woodstock.

A circular, issued by the Dominion Steel Corporation, says that the Spring Hill Collieries are transferred to the management of Arch. MacCall, general manager of the Nova Scotia Steel & Coal Co. J. J. MacDougall assist. general manager of Ocoria Coal Co. becomes assistant general manager for the Mainland district, M. Blue becomes general superintendant, for the district. A new man Thos. L. McColl of Edinboro has been appointed chief mining engineer for the district. This centralization of all the mainland collieries and plants under one executive will make for better efficiency.

OBITUARY

David W. Davies, general manager of the Canada Iron Foundries plant, Fort William, died suddenly the other day. Mr. Davies was 53 years old. He was born in Barmouth, Wales, and at an early age emigrated to Canada and took up his residence in Montreal. In the Quebec metropolis Mr. Davies entered the employ of the Grand Trunk Railway. He served with that company for several years and later became identified with the Canada Iron Foundries Ltd., and in several capacities while in the employ of the company resided at Three Rivers and Montreal. Some ten years ago Mr. Davies was chosen to take charge of the Fort William plant.

BUILDING AWARDS SHOW HEAVY DECLINE

Construction awards throughout Canada for September showed a large falling off from the total for the previous months, standing at $19,565,700, compared with $36,307,200 for August, and $20,820,100 for September, 1920, according to a report prepared by MacLean Building Reports, Limited. The value of contracts awarded during the first nine months of the year reaches a total of $185,377,800, as compared with $213,290,000 during the same period last year. If price recessions in labor and materials are taken into consideration the volume of new construction this year is estimated at about $5,000,000 greater than last year's total.

During August the wholesale price index of 48 building materials receded to 285.7, a drop of 16 points for the month, making a total of 117.3 points or 29 per cent. from the high mark of May, 1920. The peak prices reached fifteen months ago were 183.8 per cent. above 1913 costs, whereas material prices are now 100.2 per cent. above 1913 levels.

Aikenhead's

THE HOME OF FINE TOOLS

We can supply everything in tools

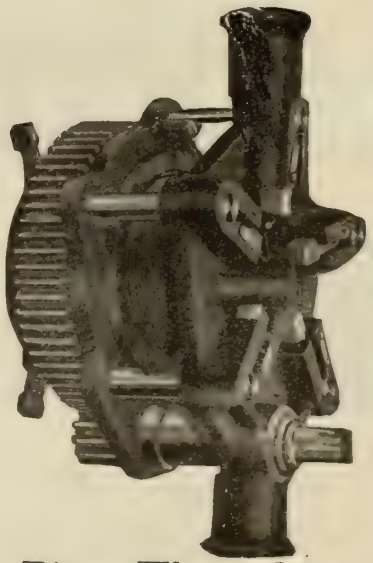
No Keys or Collets Required

The WAHLSTROM

A Chuck that Never Slips

This Automatic Drill Chuck increases production because being automatic it is not necessary to stop the drill press spindle to change tools. **Tool changes can be made in exactly two seconds.** All tools are centered automatically—a feature which alone means a 50% labor saving on some classes of drilling.

Then there is the **Walhstrom** clutch to consider. Its instant-acting jaws close with a grip that positively cannot slip. Yet there are no interlocking jaws to chew up your drills. The jaws grip on the **side** of the shank. And they grip whether the tangs are good or broken. Think what this means!—longer life, less tool expense!



Wahlstrom Chucks are made in two different styles. One style holds No. 1, 2 or 3 Morse Taper Shank Drills—with or without a tang. The other style is made in three sizes, which hold all sizes of straight shank tools from ¼ to 1 inch.

International Electric Glue Heaters

The "International" not only keeps the glue in more perfect condition but soon saves its cost in time saved and in more economical current consumption. The one quart heater consumes only one cent's worth of current per day, while the 13 quart consumes less than the ordinary electric flat iron. Three heat—full, medium and low.

PILFER-PROOF CASE

The increase in the pilferage of goods in transit in the United Kingdom has led to the invention of a special packing case which is said to be pilfer-proof. Among other advantages claimed for it are: 1.—The additional cost of construction is small. 2.—It is 100 per cent stronger than ordinary cases. 3—As no battens are employed, the shipping measurements are not increased, consequently a saving in freight is effected. At a demonstration before the London Chamber of Commerce a sample case is said to have "resisted all efforts to get into it for 20 minutes, and could not be reclosed without leaving very clear signs of its having been forced."

THE ACTUAL COST OF RAILWAY EXECUTIVES

THE salaries made by railroad officials has always been, or at least has been made out to be, a deep mystery. Hints have been thrown around widely as to the fabulous sums made by railway executives, so that the following matter which appeared in a little sheet called "Talking Points" is indeed refreshing. This pamphlet, which is issued periodically by the Central of Georgia Railway, presents some comparative figures for operation costs of 1917 and 1921. As the subject is of interest to Canada generally, the figures to follow are well worth noting. Here is what they have to say:

Occasional references to "huge salaries" that are alleged to be paid to railway executives may, unless corrected, have the effect of creating an erroneous impression in the public mind. As a matter of fact, out of every dollar expended by the railways in 1920, executive and general officers received less than one cent. Therefore, if these executives and general officers had served the railways free, the amount saved thereby would have been, comparatively speaking, very little, certainly not enough to have an effect upon either freight or passenger rates.

To be sure, there are high-salaried executives and general officers in the railway world. It is safe to say that they earn their money and that their compensation would be even larger were their energies devoted to other lines of endeavor requiring like ability and imposing equal responsibility. To be exact, the average salary of general officers in 1920 was $5,542; that of division officers, $3.319. The average pay of passenger locomotive engineers in 1920 was $3,-310—only $9 less than that of division officers.

In order to secure the services of men of ability and ambition, railways must give an opportunity for them to earn incomes comparable with other kinds of business and professional activity. If railways are not sufficiently developed and managed, their services will deteriorate, and consequently, become more expensive to the public.

Wage Reductions

The public prints recently have placed much emphasis upon the huge sums that will be saved to the railroads by the 12 per cent cut in wages authorized by the Labor Board. Headlines teem with big figures, such as $400,000,000 and other sums that stagger the imagination and are really beyond the comprehension of the average mind. So much has been said that the public may lose sight of the fact that all these "savings" and "reductions" and "decreases" are yet to come instead of actual. Here are some figures from the other side of the sheet:—

It is now costing the Central of Georgia Railway Co. $487 per month to repair locomotives, as compared with an average cost of $187 in 1917. This is an increase of 160.4 per cent. It is now costing an average of $17 per month to repair freight cars, as against $5.81 in 1917. This is an increase of 192.6 per cent.

The average revenue for handling each passenger in 1917 was $1.03. In 1921 it was $1.59, an increase of 56 cents per passenger or 54.3 per cent; while the operating expenses per passenger increased from 71 cents in 1917 to $1.55 in 1921; an increase in expense of 118.3 per cent.

The operating revenues from each ton of freight handled, increased from $1.32 in 1917 to $2.40 in 1921, an increase of 81.8; BUT the operating expenses for each ton of freight handled, increased from 92 cents in 1917 to $2.13 in 1921; an increase of 131.5 per cent.

These figures show why decreases in expenses are absolutely necessary if the railroads are to survive; and why the wage cut of 12 per cent is merely a relief and not a cure for the transportation situation.

MACHINE TOOL TRADE BETTER THAN IN 1913

Despite a heavy falling off in tonnage of general machinery imports and exports of Great Britain in 1920 and 1921, as compared with 1913, the trade in machine tools has actually increased, according to figures compiled by the American Consulate in London, England. Imports of machine tools during the first six months of 1921, says the report, were 10 per cent. above the figure for the first six months of 1913, while in exports the corresponding increase was 52 per cent.

Machine tool imports were 3.63 per cent. of the tonnage of all machinery imports in 1913; 16.8 per cent. in 1920; 6.36 per cent. in 1921. Similar figures for exports show 2.47 per cent. in 1913; 4.95 per cent. in 1920; 4.69 per cent. in 1921. In value, these figures would be slightly increased, due to the fact that machine tools average higher in unit value than the balance of the machinery entering into British imports and exports.

Textile machinery formed the largest single item shipped out in 1913, 1920, and 1921, with 88,082 tons, 21,139 tons, and 79,282 tons respectively. Agricultural machinery provided the largest tonnage of imports in 1913 and 1921, with 18,007 tons and 4,911 tons respectively: and, with 4685 tons in 1920, stood second to machine tools, with 7176 tons.

Classified Opportunities

MACHINERY WANTED

WANTED—4 old lathes and a planer; will be used for special machines so condition does not matter. Price must be low. Box 792 Canadian Machinery. (c16m)

MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W. H. Sumbling Machinery Co., Toronto. (ctfm)

POSITIONS WANTED

OPEN FOR ENGAGEMENT AS GENERAL Manager, Factory Manager or General Superintendent. Have had a good engineering education and 17 years' experience in executive positions in mechanical lines on interchangeable manufacture of typecasting machines, firearms, electrical work, experience on drop forging, heat-treating and testing of steel tool design and making. Box 793, Canadian Machinery. (c16m)

MECHANICAL ENGINEER, COLLEGE GRADuate with seven years' experience as Mechanical executive and in the design, operation and largest of Power Plants and Factories, accustomed to responsibility, desires position, best of references. Box 791, Canadian Machinery. (c16m)

MECHANICAL ENGINEER — (GRADUATE School of Technology, Gloucester, Eng.)—12 years' experience, design and production of high-class automobile and aircraft engines with leading British manufacturers. During the war attached to Air Department, British Admiralty, as supervisor of the construction of aircraft engines, including Rolls-Royce, is open for engagement. Just completed installation of industrial plant in Canada. Box No. 794, Canadian Machinery.

SALESMAN WANTED

ADVERTISER WOULD LIKE TO HEAR FROM a man who first of all is a real salesman; who has vision and a capacity for putting across big things. He should possess a knowledge of the Canadian trade, and of machine tools, and up-to-date engineering practice. State age, experience, and sufficient information to enable us to determine whether you are the man we want. The salary we are prepared to pay is big enough to attract a big man. If desired, information regarding identity of advertiser may be secured from Canadian Machinery before sending application. Apply Box 794N, Canadian Machinery.

Are You Able to Turn Your Spare Hours Into Dollars?

If not—and you are really trying to cash in on the spare moments you have during the day or after working hours—if you have made up your mind to take hold of some proposition and sail right in and actually increase your monthly income without hindering your regular work—surely you will want to know about MACLEAN'S plan for making each spare moment count. And even if you are already making money during your spare time—still you can add to your income with very little additional efforts. For you can have full particulars of MACLEAN'S plan absolutely free. If you will merely drop us a card we will send you the complete details of this plan. It will cost you nothing to find out exactly how others with spare time have materially increased their monthly earnings. For full information or the agency in your locality, write and right now,

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

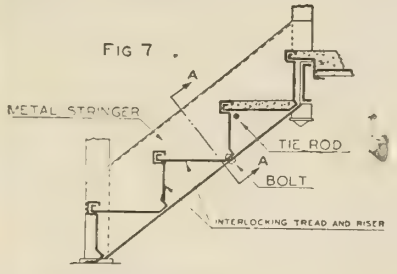
TRADE K—T MARK

Do Your Castings Cost Too Much?



A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

SECTION OF METAL STAIRS

STAIR SAFETY

No factory or manufacturing plant should be without fire-proof stairs. Wooden stairs have been the death trap of thousands.

For ease of erection, rigidity and permanence "BOIS PATENT" interlocking steel stairs are unequalled. **They are also absolutely fire-proof.**

Look at the illustration. It shows the patent interlocking feature which eliminates all bolting and riveting and which has made the "BOIS PATENT" the favourite stair of engineers and architects.

"BOIS PATENT" interlocking steel stairs can be supplied to take metal, slate, asphalt, marble or composition treads. One of the five types will meet your requirements.

Sole Canadian Manufacturers.

Your Heavy Jobs Automatically— on a GRIDLEY

Many heavy jobs in turning, drilling and forming work formerly done the long way are being switched to the Gridley Automatic basis.

They take the fast feeds and their accuracies stand up under continuous running. They save time between cuts, reduce labor costs, conserve space.

New friends adopt Gridleys, and old users buy more of them because they **know** that they produce more, save more and earn more per dollar of investment.

Gridleys give production that will meet the competition of lowering costs—why not find out how many on your work?

OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

"Liquid Air" Oxygen Means a Saving in Transportation

With a network of Factories, not only planned, but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This completely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and even minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases this expense is almost eliminated.

STAYBOLT TAPS

The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper, "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

The efficiency-point of a file has been passed as soon as its teeth have lost their sharpness.

It pays to watch closely for signs of wear.

Discard the file then—a new file costs less than the labor-time wastefully expended on an old one.

Long efficient service from every file is ensured by ordering one of these famous brands:

Kearney & Foot
Great Western
American
Arcade
Globe

THE
ACKWORTHIE
TAPPING
ATTACHMENT.

BRITAIN'S PREMIER CHUCK

Made in 6 sizes.
To tap from ⅛ in. to 1¼ in. Whit.

We have made some thousands of these Chucks during the last 11 years, every one of which has given satisfaction. For tapping holes there is nothing to equal them for speed and handiness.

Shall we mail you particulars?

J. ACKWORTHIE, Ltd.
Coleshill Street,
BIRMINGHAM

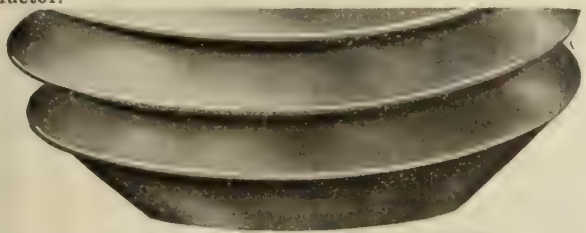
HAVE YOU
A CASTING PROBLEM?
IS IT SIZE, WEIGHT,
OR SPECIAL RIGGING?

We Can Make the Piece for You

as we are organized and equipped for the production of large complicated foundry work of all kinds.

We will also do the machining, if desired. Our equipment for machining large work is the most complete in Canada, and we handle fly wheels and circular castings up to 35 feet diameter.

If you will submit your blue prints and specifications, we will gladly quote figures.



DOMINION ENGINEERING WORKS LIMITED

TRADE MARK
BRISTO
REG. U. S. PAT. OFFICE
PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

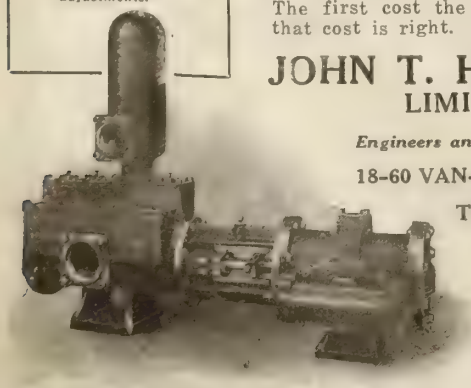
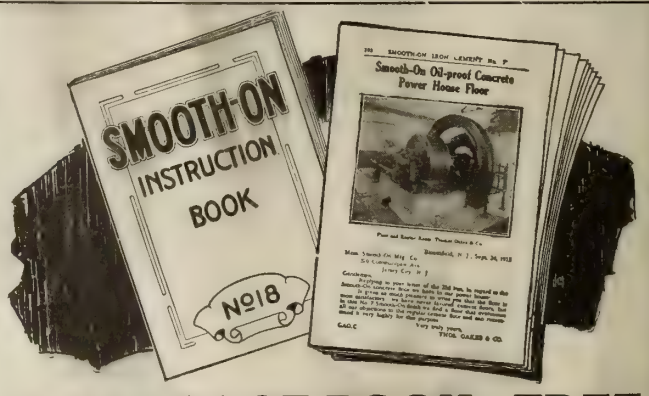
HEPBURN
PATENT FEED PUMPS



First cost the Whole Cost!

The great thing about using a Hepburn Steam Pump is that once you've paid for it you don't have to keep spending additional money for adjustments.

THE Hepburn Steam Pump is built to Pump—and Pump it Does. The steam chest is located on the side of the cylinder and the low ports automatically drain away all condensation. This prevents water hammer in the cylinder; insures a perfect cushion for the steam piston, and gives a full stroke all the time.



No levers or tappets to get out of order.

The first cost the whole cost and that cost is right.

JOHN T. HEPBURN
LIMITED
Engineers and Iron Founders
18-60 VAN-HORNE ST.
TORONTO, CAN.

We also make: Vertical Engines, Compressors, Winches. Cut Gears, Derricks, Brick Machinery Hydrants, Forgings, and Grey Iron Castings.

A 144 PAGE BOOK—FREE
Written *by* and *for* Engineers

This latest edition has been completely revised—new material inserted, new repair problems described.

The Smooth-On Instruction Book No. 18 is the most valuable book of its kind. Its 144 pages contain sound practical and money-saving advice on various power plant and boiler room repairs. Its compilation has been contributed to by engineers the country over.

Your copy is waiting—all we want is a word from you and we will send it along.

THE JOHNSON FRICTION CLUTCH

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

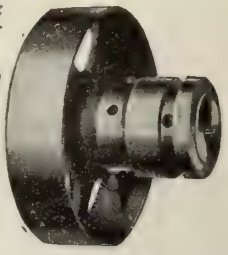
It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.



Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building." and our Yellow Catalog.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

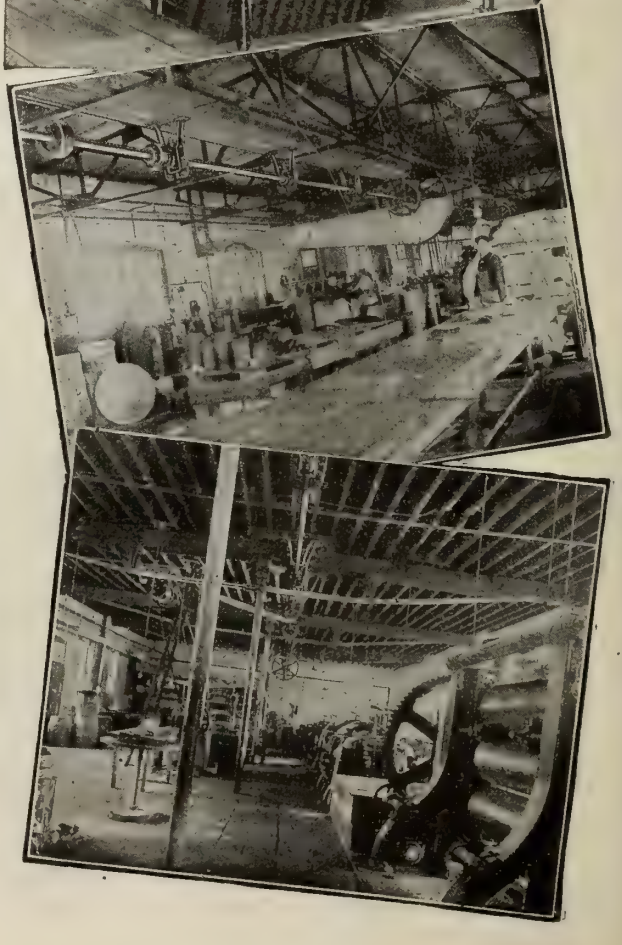
DODGE



You can always depend on a Dodge Rope Drive

Dodge Rope Drive dependability is not spasmodic. Time-tested in hundreds of plants, Dodge Rope Drives have always stood up to every demand that continued hard service can make.

And service-assurance is not the only reason why a Dodge Rope Drive is the logical prime mover in any shop.

The economy of buying rope by the pound against replacing belt of excessive width is of equal importance—as is also the fact that the rope delivers more nearly 100% of the engine power than does the belt.

However short the center-to-center distance; however complicated the problem of carrying power around corners or from floor to floor, a Dodge Rope Drive may be depended upon fully and continuously to be the simplest and most economical means of accomplishing the desired results.

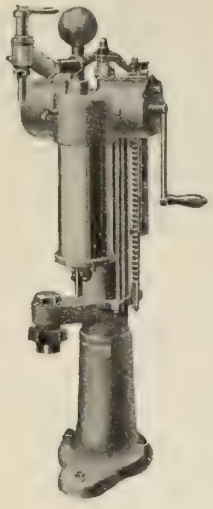
Speeds Up Garage Work

This is the high-speed hoist that is doing so much for the garage men throughout the country by saving their time. With it a load can be lifted in half the time required when an ordinary hoist is used.

Let us tell you more about it.

WRIGHT MANUFACTURING COMPANY



Lisbon, Ohio, U. S. A.

Do You Read These Advertisements?

Every advertisement in this magazine is worth reading. It is the product of some concern that is using a modern method of making sales, viz., technical paper advertising, in order to present most effectively to you the leading features of its line.

These advertisers are making it easier for you to buy intelligently with the least waste of your time and theirs. They realize that a sales force cannot replace this service at equal cost. They know that advertising is good business, for the manufacturer who does not advertise cannot save the cost of advertising. Consistent advertisers are progressive merchandisers. They are saving your money and their own; and it pays to do business with them.

Don't miss your opportunities. These advertisements are interesting. Many are distinctly instructive, and a glance through them every month will keep you posted on the latest developments for machinery equipment.

Better Gasoline At Less Cost

The installation of Bowser Piston-Type Measuring Pumps for storing and handling gasoline in your plant will mean economy in every sense of the word. By measuring accurately all disbursements, they keep an absolute check on consumption. Pumping the gasoline directly into the distributing container, they eliminate spillage in transfer.

Bowser Equipment also effects worth-while savings in gasoline costs—enabling you to buy in carload lots and at quantity prices.

Bowser stores gasoline safely underground, while pumps may be located at any convenient points. Their accessibility saves time and labor.

Men with selling problems will find a profitable tip in the statement made by a prominent manufacturer recently, "I use MacLean Publications because I am satisfied that papers with such a high standard of editorial excellence, MUST have an influential following."

Sturtevant
(TRADE MARK)

THE POPULAR AIR LINE

The STURTEVANT Indirect System of Heating and Ventilating might well be called The Popular Air Line, because Sturtevant installations on practically every railroad in the United States and Canada have proved that it assures *direct returns with a direct dollar and cents value.*

That is why the history of Sturtevant installations is *replete with repeats.* As for instance in the Angus shops of the Canadian Pacific, views of which are here shown. For Sturtevant put air to work so effectively in those shops as first constructed, that when, in order to speed up construction of equipment, they were greatly enlarged, the Canadian Pacific once more turned to Sturtevant.

First, because they had learned the *"speed up quality"* of good air, and second because experience had taught them what Sturtevant quality means—a system right to start with and properly installed needs few repairs. Exactly-greater output of work at smaller outlay of dollars.

Send for Catalog 1010 *fully describing the STURTEVANT Popular Air Line for Railways.*

U.S. Electric Drills for Every Need

U. S. Portable Electric Drills have a usefulness to which there is hardly any limit. Wherever there is light drilling to be done you can take one of these drills to the job, and attach the plug to a lamp socket, whether the current is direct or alternating.

Drills may be had in two speeds, with switch to start and stop conveniently placed in handle. The motor is air-cooled and all bearings are ground to size and hardened.

The drill illustrated is adapted for drilling up close to corners.

Cutting the Time in Three by Disc Grinding

Disc Grinding Can Often Reduce Cost of Operation—Suitable Fixtures are Important If Production Is to be Increased—Disc Grinding Scale Bases—Counter Tare—Door Frame

By J. H. MOORE

THE variety of work which can be successfully performed by the disc grinding process, rests to a large extent upon the designer's ingenuity. In many cases parts which have been thought unsuited for disc grinding have to be re-designed in some simple manner, with the result that the pieces can be produced on the disc grinder at a much lower cost, not to speak of the better finish secured.

When producing any part on such a grinder there are several important factors which must be watched. The amount of stock to be removed should be carefully considered; the distribution of the surface to be ground is important, and wherever possible the piece should be designed to take care of, and absorb the heat from the portion of casting being ground. As a rule the allowance for disc grinding varies from .005 to .050 in. In exceptional cases as high as ¼ in. has been removed from cast iron and brass surfaces, although such a heavy grind is not to be recommended as good practice.

As can be readily understood the amount of material which can be profitably removed from a piece, depends upon the nature of the material; the speed of the abrasive; and as stated before the distribution of the surface to be ground. Cast iron is usually easier to grind than rolled or wrought metals, but when iron castings are very thin in sections, they are often harder to grind.

Another point to watch is outside scale. This should be removed as much as possible from the castings before disc grinding, for scale is hard on the abrasive disc. Where the scale is exceptionally heavy it pays to use some form of grinding wheel before completing the part on the regular disc.

Importance of Fixtures

As disc grinding is a heavy production asset, nothing should be placed in its way, so far as rapid handling is concerned. Many a disc grinding machine today could give far better service were it equipped with suitable fixtures to handle the work. It is hardly necessary to plead the cause of fixtures, for the benefits which have been derived from the use of the same are apparent in every industry. Without accurate fixtures we could never have secured inter-

Fig. 2.—Disc grinding face of cylinder scale base.

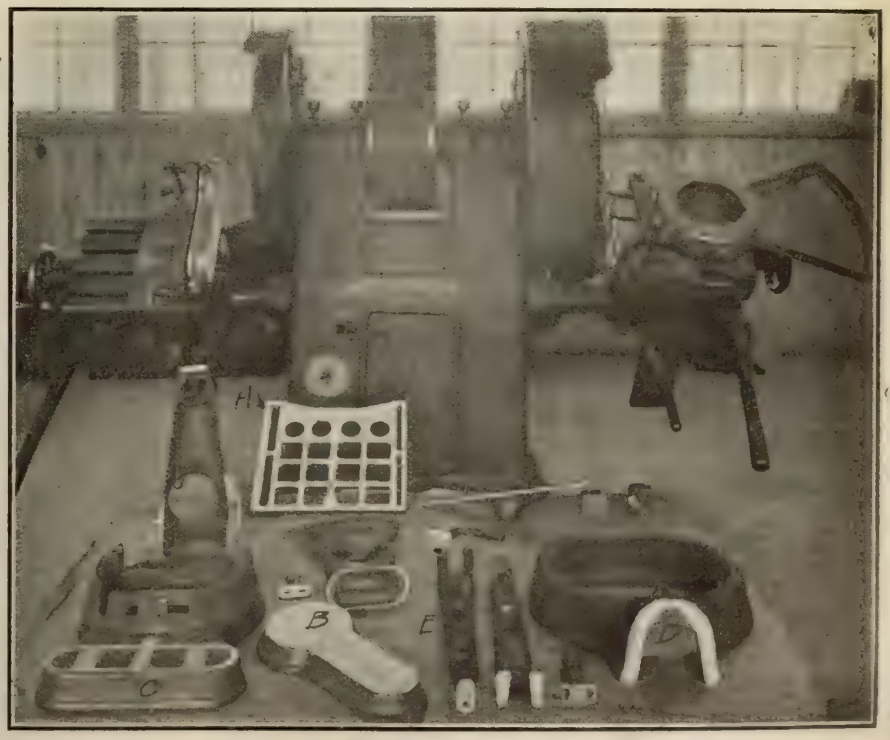

Fig. 1.—Collection of parts finished on disc grinder.

changeability, and without the latter we could never have brought production costs to their present low level. A foreman therefore should see to it that his grinder is equipped with the necessary jigs which will not only locate, but handle the parts efficiently. Any expense incurred at the start will soon be wiped out by the profits made through increased production.

Without dwelling any longer on the necessary preparations, we will next consider some actual examples of disc grinding as performed in Canadian plants. The photographs to follow are reproduced through the courtesy of the Ford-Smith Machine Co., Hamilton, Ont., who are designers of the equipment. In general manufacturing there are very few materials that do not lend themselves to the process of disc grinding, so that the field of usefulness is extremely wide. For example, look at Fig. 1. In this group is shown a collection of parts machined on the disc grinder by the Brantford Computing Scale Co., Brantford, Ont. It will be noted in the photograph that the surfaces to be ground are lighter in color, these having been chalked up in order to show the surfaces plainly in the illustrations. An idea of the scope of work completed at this plant alone by disc grinding is self evident. The piece A, which is seen resting against the machine is finished on both sides, and is completed in ten minutes. The part B is a candy scale base and the entire top of this piece is finished in 4 minutes. C depicts a 20 lb. fan scale housing base, and in place of a former milling time of 12 minutes, this part is now completed in 3 minutes.

At D is shown a skeleton base which is ground in three minutes on both ends, against a former milling time of ten minutes. Part E was formerly milled

Fig. 5—Disc grinding door frame of electric range

in 8 minutes, but is now disc ground in half that time. This view also gives a good idea of how fixtures serve to increase production. Imagine an operator holding up the various parts shown to the disc. He would soon tire of the work and his production would drop, but with the fixture holding the piece accurately and firmly, all the operator needs to do is move his table back and forth, thus passing the part to and fro on the disc.

At Fig. 2 we see the operator grinding the face of a spring cylinder scale base, while Fig. 3 shows the disc grinder producing a very important part of the scale, known commercially, as the counter tare poise. This work must be continually weighed, which explains the scale to the operator's right hand. The Brantford Scale Co. reported to the author that by grinding in this way they secure an excellent job; it enables them to keep the poise square, and it also allows them to quickly ascertain the weight.

Fig. 4 is also very interesting. In this case the operator is grinding the face of a meat slicer and the original method of face milling took 6 minutes, while with the disc method, the piece is now completed in one third the time. The new system is also claimed to be the most satisfactory.

At the Canadian Edison Co., Stratford, Ont., they produce a great variety of parts by the disc grinding process. One of these, the door frame of an electric range, is shown at Fig. 5. The size of this frame is 18¾ in. x 12¼ in., and the face of the range door only is ground. The thickness of the edge face is 3-16 in., and the average time of operation is 4¼ minutes. The disc runs at 1350 r. p. m. and is 24 in. diameter.

The remaining illustration, Fig. 6, shows an 18 in. machine being used at the Hydro Electric works in Toronto. This concern use these machines for practically every conceivable part of electrical equipment. Speaking to the foreman regarding their use, the author enquired if he, the foreman, believed in the necessity of proper fixtures. This question was asked because it was noted that all the machines were being operated by hand, that is as far as holding the work was concerned.

The reply, while not couched in ideal language, was just what we wanted, "I'll say I do," said the foreman, "and what's more I would have them on now, but the machines have just been installed. In spite of this inconvenience however, I couldn't wait for the fixtures which are

Fig. 3.—Disc grinding the counter tare poise.

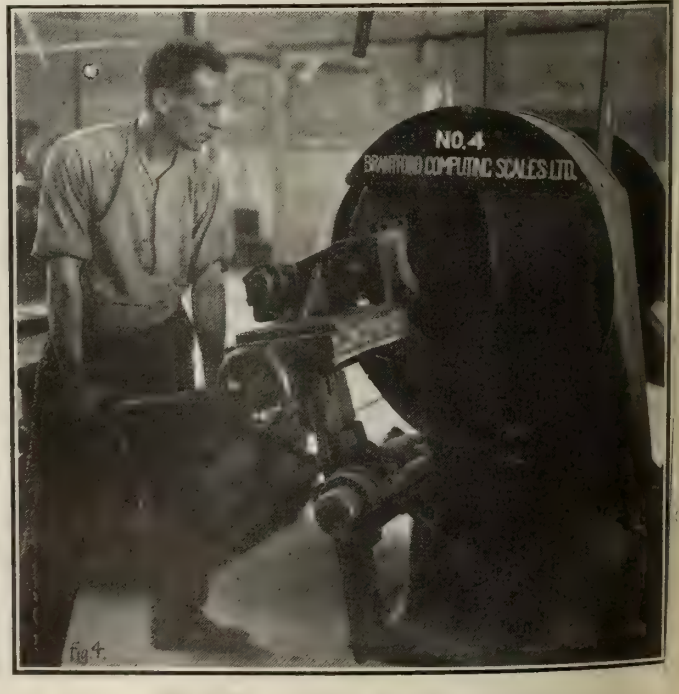

Fig. 4—Disc grinding face of a meat slicer.

being made, for even holding the parts by hand, we find that production has considerably increased." This testimony stands on its own. If, without fixtures, such a condition holds good, what will happen when everything is installed?

Before leaving the subject, we will consider the question of the proper discs to use. Abrasive discs can be secured in various combinations and grades. As a rule, manufacturers number their various discs, and are only too anxious to supply a user of a disc grinder with full information regarding what the various grades are best suited for. You cannot expect the same grain of disc to work equally well on two extremes, such as brass and steel stampings, therefore the best plan is to consult the manufacturer; secure from him a list of the abrasive discs handled; their uses, etc., then keep this information for future reference. You would hardly expect a poor quality carbon drill to drill as quickly as a first quality high speed steel product, therefore to get the most out of a disc grinding machine you must feed it with the very best discs obtainable.

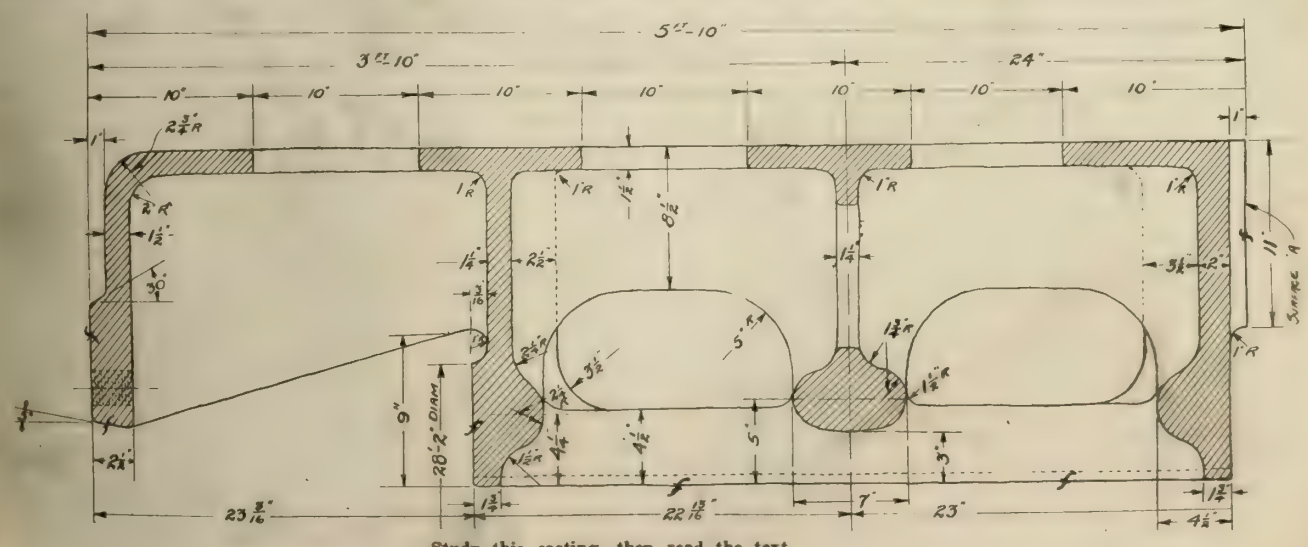
Fig. 6—This disc grinder is used for grinding all sorts of electrical equipment.

What is the Money Value of Experience?

By Donald A. Hampson

WHEN the men of the U.S. were registering under the draft law, they were requested to fill out an extended questionnaire, among other things placing themselves in certain classes with reference to liability for military service. These voluntary classifications were later changed in accordance with the views of the draft board members, who generally doubted the soundness of the registrant's reasons as stated to show their right to deferred classification.

In the case of men in mechanical lines, the reason given by them was that of "experience," more or less extensive. Lawyer members of boards were prone to believe that men with ten years of machine shop or drafting room experience could not be replaced by any sort of labor gathered up. And it is true that most of the actual PRODUCING was done by green help, BUT the green help could not produce until the experienced had planned and built, and was guiding the work throughout. Some of the most notable cases of delay and of rejections followed the attempts of Army men and theorists to produce accurate mechanisms without the aid of the despised men of experience.



This same "experience" is an elusive thing—it cannot be purchased as can another commodity, it is not found in textbooks; based upon practice, some slight change in conditions may necessitate an entirely different procedure such as experience only can direct. Experience affects our attitude toward quantities as well as toward different materials and local conditions. As an example of how experience forewarns, consider the part shown by the drawing—a simple grey iron cast which is to be finished on the ends after the sides have been machined—twenty-five pieces in the batch.

Here is how the man of little experience would reason out his procedure. "The piece is finished all over when I get it except for the ends—now all I've got to do is put a vise on a milling machine, setting it by the marks, grasp the castings one or two at a time and finish both ends by means of two straddle mills which I can easily set by using the sample piece for a gauge in setting the cutters." That reasoning appears sound and it is, within the powers of most people with a smattering of all around experience. Now let us study these proposed moves for the trouble which is certain to come.

Actually What Happens

First the zero and the 90 degree marks on the vise are not close enough for accurate work—the tongue on the under face of the vise may be a loose fit in the T-slot or it may be battered—dirt or burrs or bruises will tip the vise when they exist unnoticed on the bottom and they will tip the work pieces when they exist between the jaws. Someone rises to remark that these sources of error could not exist in a first class plant; but all of us know that they do and always will after a machine has seen a few months of general service. The only way to start an accurate job is to go over the surfaces concerned with a smooth file, removing any burrs, and then to check the setting with a square both ways against the column of the miller. Following this, a trial piece or two are run through and the ends checked both ways with an accurate square.

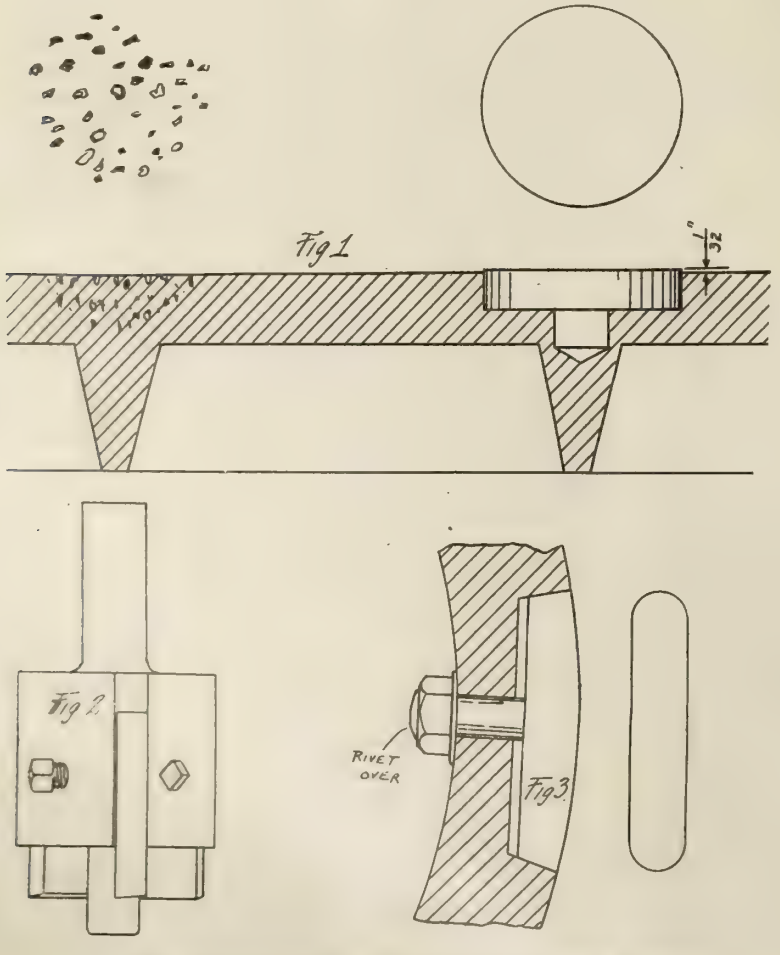
The Plugging of Holes in Cast Iron Surfaces



Holes May be Plugged in Many Ways Such as Filler—Burning—Welding—Mechanical Repairs, etc.—The Best Method for Each Case Explained—Sketches Showing How to Accomplish Repairs

By DONALD A. HAMPSON

CASTING defects always have existed and there is every reason to believe that they always will. When they are not so bad as to impair the casting's strength or utility, it is customary to doctor up the pieces in such a way as to render them acceptable. Confining ourselves to holes in castings, the methods of repair or salvage may be enumerated as follows: Iron filler, burning, welding, machine filler, or putty, and mechanical repairs such as plugs, patches, and inserts. These methods may be adopted for new work and for repair jobs, the particular one that is selected depending upon the nature of the service in which the casting is used.

Iron filler is sold under various trade names. It is much used in foundries for filling up holes and indentations before sending out castings. When the surface of a casting does not have to be machined and the cross section is amply strong, iron filler may consistently be used since it adheres tenaciously to the adjoining iron and becomes to all intents as hard as the rest of the casting. But where the part must be machined to become an important surface, iron filler is objectionable both on account of its different appearance from the rest of the cut and of its insufficient wearing quality. This filler, in the bulk, appears like a flour composed of cast iron and graphite; in use, this flour is mixed with water to a pasty condition and then worked into the cavity to be filled. The machine cut that runs through iron and filler leaves the filled spot of a rusty color.

Iron filler is also used on exterior surfaces that must present a smooth appearance. This is done in the finishing room after all the work on a machine is completed. The filler is worked in the depressions with a putty knife, allowed to harden, is sand papered off, and finally painted over when the rest of the machine's surface is painted.

Follow the text matter, as it explains these sketches thoroughly.

Burning In

Burning, or burning-in, is a foundry "stunt" that has been practised for generations and was the nearest to welding that was known up to the time of the twentieth century welding processes. It is practised chiefly as a means of saving castings that show large holes from a shifting of sand in the mold or from other causes, though a good many repair jobs have been accomplished in this manner. The writer has seen the most substantial repairs made in this way on the heads of retorts, broken flanges, plates, etc.

Burning is done in the foundry exclusively. Briefly the process consists of building a temporary mould about the defective portion of the casting with a large head above and suitable provision for a run-off below. Hot iron from the cupola is poured in the mould, strikes the defective casting, and passes off below; in its contact with the casting, the iron heats the latter and when enough has passed to raise the adjacent section to a full red heat, the outlet below is stopped and pouring is discontinued when the risers are full as with any other casting. When cool, projections and sprues are chipped off in the usual manner.

Welding is for the most part confined to the oxy-acetylene process, with electric welding practised in the bigger shops and thermit welding in special cases. But in the great majority of plants—where there is work enough to keep only one or two men at welding, or welding part of the time—the "gas" weld is the process employed. It is the recognised all-around method. Holes in castings may be readily filled up by the torch and welding rod. It is a simple cheap way of saving thousands of castings. There are cases where a weld will not do any good where a defective casting must be scrapped, as for instance, a hole in the ways of a lathe bed or in the face of a surface plate or where a casting is subjected to tensile stress and its position does not permit of any increase in section.

Machine filler is a product of the paint maker. It is distinctly a surface coating intended to assist in the preparation of a smooth exterior. Applied with a putty knife to holes and with a brush over a surface generally, it fills up the hollows and general roughnesses so that when hard it may be sanded off ready to receive the finishing coat of paint and take its part in the smooth exterior we so admire on machine tools, motors, and other high class machinery. But machine filler does not adhere as well as some other

fillings and for that reason large holes are better filled by welding. Filler parts subject to jar are better not built up with either non-filler or machine filler unless holes or under cuts are put in to anchor the paste.

Mechanical filling of casting holes usually takes place after the part has being machined or as a repair job on a casting that has been damaged in service. The mechanical repair is generally confined to those parts where an accurate surface and a good finish are desired; the repair adds nothing to the strength of the part—rather, it takes away from it for it is customary to drill and chip away more of the section in order to get definite faces to plug. The hole to be filled up is enlarged by drilling one hole or else by several holes and chipping out between them; then a plug is made to be a driving fit in the new hole, is forced home, peened carefully around the edges and filed or machined to the original level.

Work for the printing industry calls for mechanical filling of holes to a greater extent than any other. The demands in this line are so exacting and so different and the business is so wide spread, reaching into the smallest hamlet, that some of the work will be detailed. Printing is all done by the impression on type between two metal faces. Both of these faces may be flat, as on a job press or the plates of a Washington hand press, or one may be flat and the other cylindrical, as with the common cylinder press, or both may be cylindrical, as the presses of great metropolitan dailies or the presses for the various ornamental and advertising processes. In some of these processes, ordinary type is used—others make use of linotype matter or plates but no matter what the process, the surfaces must be so good that every dot and serif must show on printed matter.

Increasing labor costs have made it necessary to use larger and larger presses and these have forced a corresponding increase in the size of other press and composing room equipment. As a result quantities of large castings have to be turned out with surfaces well nigh perfect. To produce castings with from 4000 to 9000 square inches that don't have so much as a pin hole showing after being machined is something of a triumph! And it is done right along with cylinders and flat beds, though the vast majority of such beds have tops made of marble. Many of these marble tops, if turned over would startle the visitor with the carved letters, "In memory of.." but these are being replaced at the rate of about five a day by cast iron tops which do not abrade like the cheaper marble.

A full size section of one of these iron imposing tops is shown by Fig. 1. These must be machined true within "less than a piece of newspaper" and any spongings or holes filled up to form an accurate working surface and to resist the hammering they get. In keeping with the large sizes of presses, these surfaces now average 3,500 square inches, a size that with their light section makes it difficult to cast so that they machine up sound—a close grained iron poured from gates scientifically arranged into a mould properly heated and vented—all these things are necessary to success. Then if the casting warps, the tool cuts so deeply into the high parts that spongy sections show up over the rib crosses.

Above Fig. 1, at the left, is shown how the surface appears over one of these crosses after considerable metal has been removed. A few holes might be plugged with ⅛ in. pins but generally the structure is so spongy that the iron surrounding pins would not stand the pounding in a print shop and the whole section has to be cut and plugged to save a casting that cost nearly a hundred dollars. This defect is noted, of course, before the finishing cut is taken on the planer and is repaired at that point, in the manner illustrated at the right of Fig. 1. A hole from 1 in. to 1½ in. is counterbored and filled with a turned plug of cast iron which is left slightly higher than the rest of the surface so that it can be peened down at the edges, filling any crevices left at the mouth of the drill. Subsequent cuts with a flat tool may remove as much as 1/32 in. but where the work has been done by a skilled workman, it is impossible to detect the repair except under a strong light and then only by one accustomed to such things.

Whereas a spongy surface even with minute openings will not pass as a "second," the trade willingly accepts a surface plugged as we have described as the highest class product. The secret of success with this work consists of putting in a tight plug, carefully fitted, of the same material as the plate itself, and doing it on the planer so that the finshing cut runs over all. The work might be just as well done afterwards and the surface worked down by hand without scratching but then the workmanlike finish—"looks like a pair of striped trousers," one visitor remarked—would be broken by circles of another shade and the plug would fairly scream for attention.

Pin holes can be filled with ⅛ pins without making themselves noticeable. Larger holes and soft spots are filled with ⅜ in. and ½ in. plugs that are turned up in the form of rods for the purpose. Still larger ones are filled as described, in which process a ½ in. pilot hole is first drilled for the counterboring tool of Fig. 2. This tool has a carbon steel body with three inserted high speed blades. An electric drill speeded at 500 R. P. M. or less will put in these holes without tieing up a planer very long.

The method of plugging imposing surfaces has been dwelt upon in detail because they are the most annoying pieces in the list to repair and because such methods are employed or may be employed for a variety of work. Cylinders are plugged in like manner though in shops which grind the faces rather than finish with a tool, steel or wrought iron plugs are often employed for the grinder finish looks practically the same on all three materials.

A repair job cannot be expected to bear the same finish that a new one does and so the machinist puts steel plugs and inserts in proof presses and cylinder presses. Fig. 3 shows a patch used in the field by men of the Miehle works and others. The reason for patching is always the loosening of material in the form and the material's getting on top of the type and thus being squeezed into the platen or cylinder of the press. This patch is used to build up the dent left by a steel quoin that "went through the press" necessitating an oval shaped repair.

THE CLYDE'S LARGEST DREDGER

The largest dredger ever built on the Clyde was launched recently. It has a hopper capacity of 80,000 cubic feet and carries a suction pipe by which dredging can be done to a depth of 45 feet. Special arrangements have been made to enable dredging to be continued when the vessel is going either ahead or astern. This dredger is designed for dealing with light sand at the mouth of an Indian river, and an ingenious device has been fitted to trap this light sand so that none of it is wasted in the overflow. Everything in the hull and equipment is A. 1. at Lloyds. A complete system of electric lighting, including one searchlight, has been installed. The pumps are driven by a special set of triple expansion engines and are capable of raising and discharging about 5,000 tons of sand and silt per hour.

BRITAIN'S LATEST AEROPLANE

The latest type of British passenger-carrying aeroplane has an enclosed cabin for eight passengers and an open cockpit for the pilot and mechanic. It is a biplane driven by a single engine of 450 horse power. The seats are made collapsible so that practically the whole of the cabin space may be used for cargo if desired. An interesting detail is that for the benefit of passengers liable to air sickness a small concealed self-emtying basin is provided close to each seat. Windows to open are fitted on the full length of each side of the cabin and heating is provided by hot air muffs round the exhaust pipes. The pilot's cockpit is fitted with a complete wireless telephone and telegraph installation. This machine when fully loaded, takes only 9 minutes to climb to 5,000 feet, at which height its speed is 118 miles per hour. Fuel and oil sufficient for a journey of 400 miles are carried on board.

Use of Ball Bearings as Adapted to Grinders

Plain Shop Grinder—Grinding and Polishing Head Applications —Disc Grinder—Use of Self-Aligning Ball Bearings in Housings — Vertical Surface Grinder Application— Precision Grinder

By DONALD A. HAMPSON

THE introduction of ball bearings into various machine tools, and their great success in this direction, has aroused in the minds of keen engineers and progressive manufacturers the spirit of interest that formulates itself into two questions, viz.: Where else can ball bearings be used to advantage, and what improvements will they effect?

Briefly enumerated, here are some of the salient features of improvements and economics that ball bearings have effected in the manufacture and functions of various types of grinders and buffers.

1, Lower production costs; 2, increased output; 3, higher efficiency; 4, maintained accuracy; 5, infrequent and easy lubrication; 6, reduction of maintenance cost, by elimination of adjustments, renewals, stoppages for repairs, etc.; 7, saving in first cost by eliminating countershaft and belts.

Ball bearings being narrow and compact, the finished bearing seat is usually less than one-third the length r quired on a cast iron, babbitt, or bron bearing. The length of the bearing ca ings necessary for stability when oth

*Mr. Jones is manager of the S. K. F. Ball Bearing Co., Toronto, Canada, and it is through their courtesy that this matter and illustrations are reproduced.

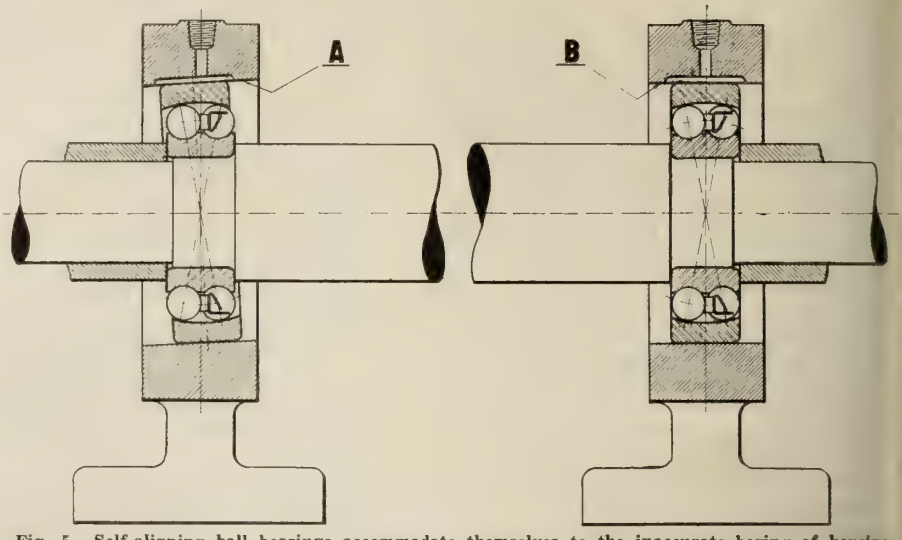


Fig. 5.—Self-aligning ball bearings accommodate themselves to the inaccurate boring of housing

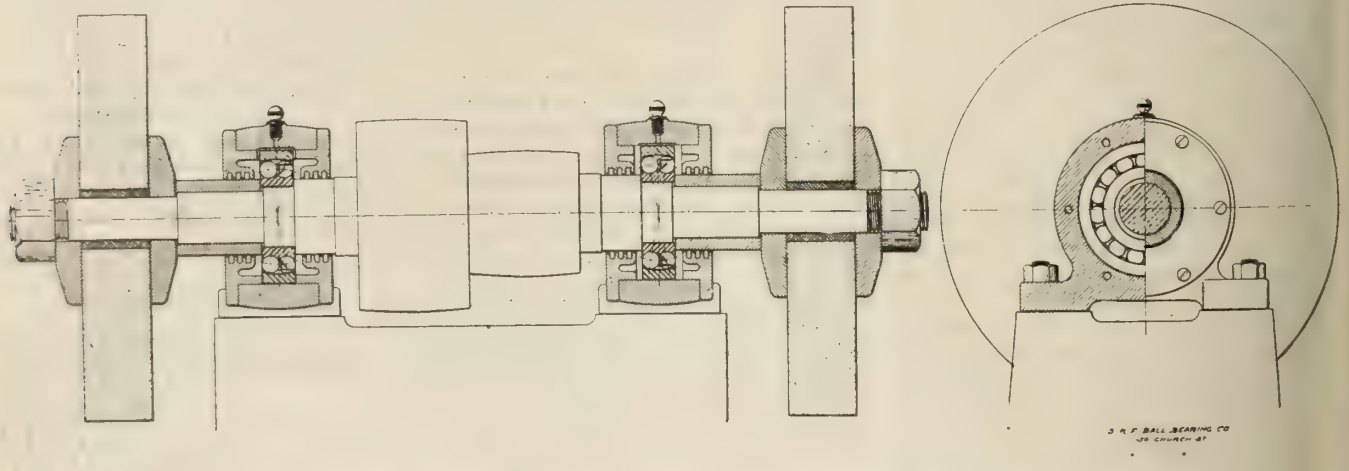

Fig. 2.—Grinder head fitted with two step cone. A groove housing cap prevents dust from entering bearings.

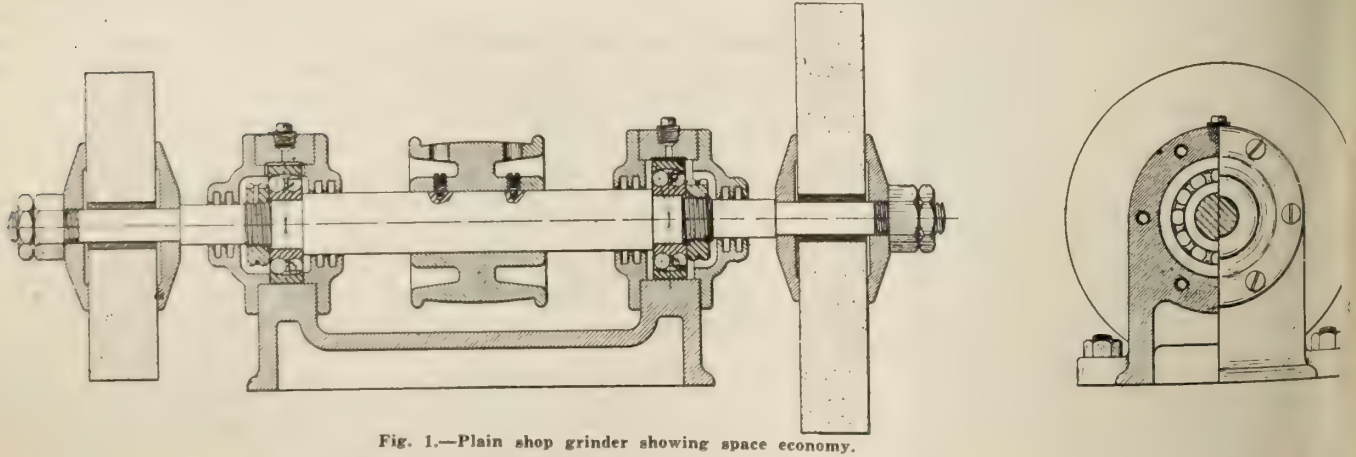

Fig. 1.—Plain shop grinder showing space economy.

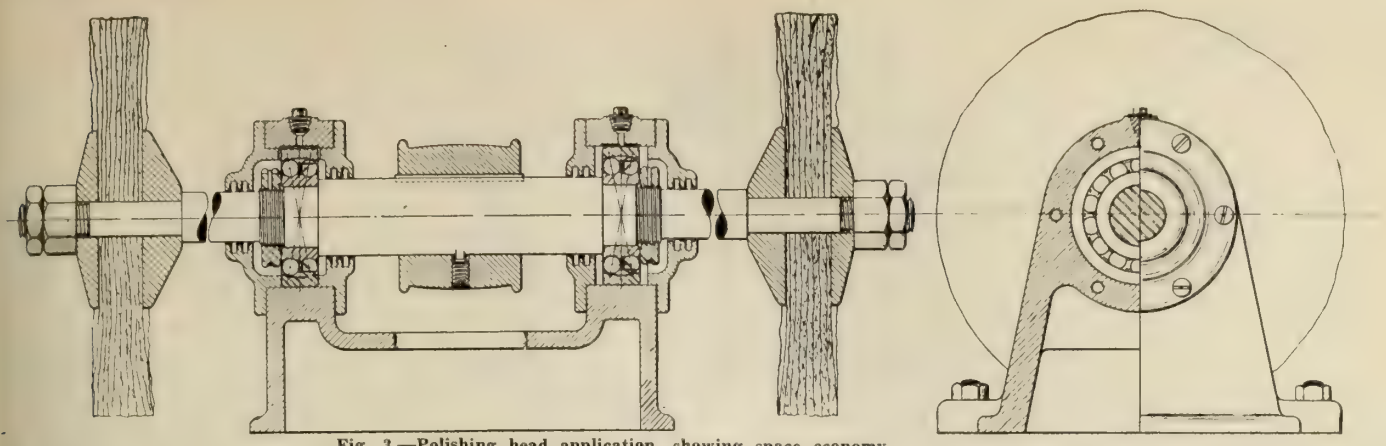

Fig. 3.—Polishing head application, showing space economy.

types of rigid bearings are employed is proportionally decreased. This means reducing the cost of machine work and shortening the machine length, see fig. 1, with the resultant saving in floor space and weight, therefore a reduction in the cost of manufacture.

Instead of machining the whole length of the journal box, placing and scraping the bearing lining, and machining a corresponding length of shaft for this box, the manufacturer can substitute the simple process of boring and reaming short housings for reception of ball bearings.

Reduce Cost of Material

In machines using sleeve bearings running at high speed, to resist wear from rubbing friction, the shaft must be made of fine grade material. There is no wear on the shaft when ball bearings are used. Friction is eliminated by the extreme precision with which they are made, and by substitution of rolling action in place of rubbing friction. Consequently on a ball bearing machine, cheaper material for the shaft may be used, which is a very important item of economy. It means cheaper production and increased profit with increased efficiency and durability.

In Fig. 1 a plain shop grinder is shown with a single pulley, which is driven direct from the lineshaft eliminating the expense of countershaft and belting and removing a very unsightly overhead arrangement of gear. It is an established fact that it takes less power to run a ball bearing grinder continuously, than to run a plain loose pulley on the countershaft; besides this, power and workman's time is saved starting up the machine each time he wishes to use it. The replacement of the wheel (which is very seldom) is done when the shop is idle, or by throwing the belt off the driving pulley.

Plain bearings supporting short shafts generally have to be bored in one operation to obtain concentricity of both bearing seats, and ensure correct alignment. On long shafts when the bearings are placed far apart, alignment is frequently secured by ball seated journals or aligning cradles, both of which are costly to manufacture and troublesome to maintain. Where self aligning ball bearings are used, they provide automatically for instantaneous alignment and adjust themselves to proper alignment, even if the housing bores are not absolutely concentric. See Fig. 5.

Saving of Power

Shafts in sleeve bearings frequently become set if a machine is idle, and it takes from 50 per cent. to 200 per cent. of normal running power to start a plain bearing machine from rest. The frictional resistance on a properly constructed ball bearing of high grade materials is practically constant at all speeds: i.e., the frictional resistance to be overcome at starting is no greater than when a machine is running at full speed. Consequently the machine is easy to start and operates at the highest possible efficiency. Rubber belts are cheaper than leather, but as they cannot be used advantageously where there is a possibility of oil leaking from a plain bearing and rotting them, leather must be used on plain grinders. With a ball bearing machine this condition is changed, the housings being proof

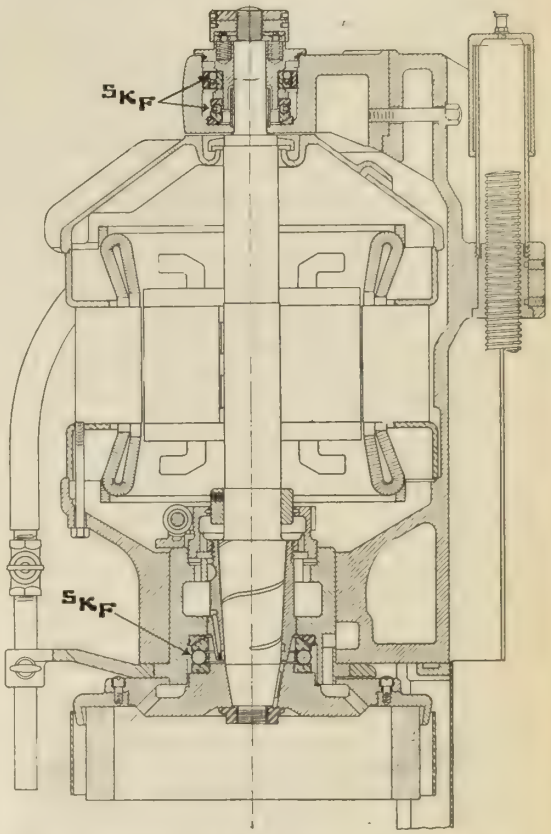

Fig. 7.—Application of ball bearings to vertical surface grinder spindle.

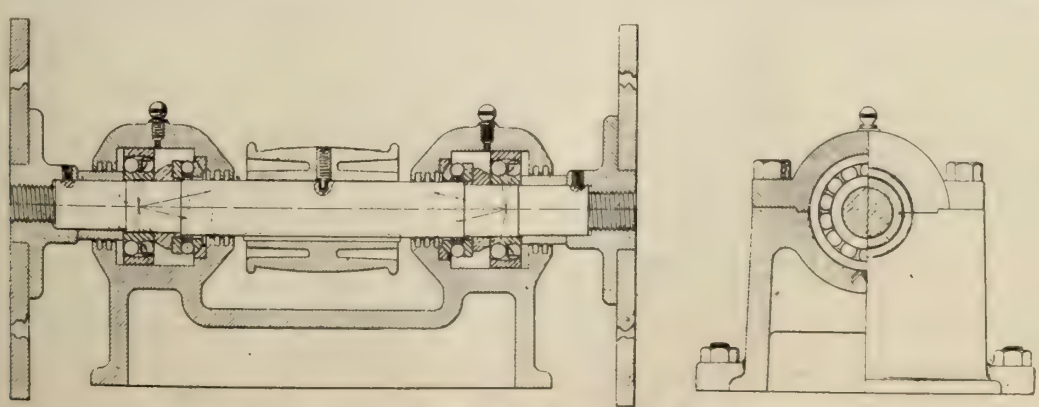

Fig. 4—Disc grinder equipped with radial and thrust bearings.

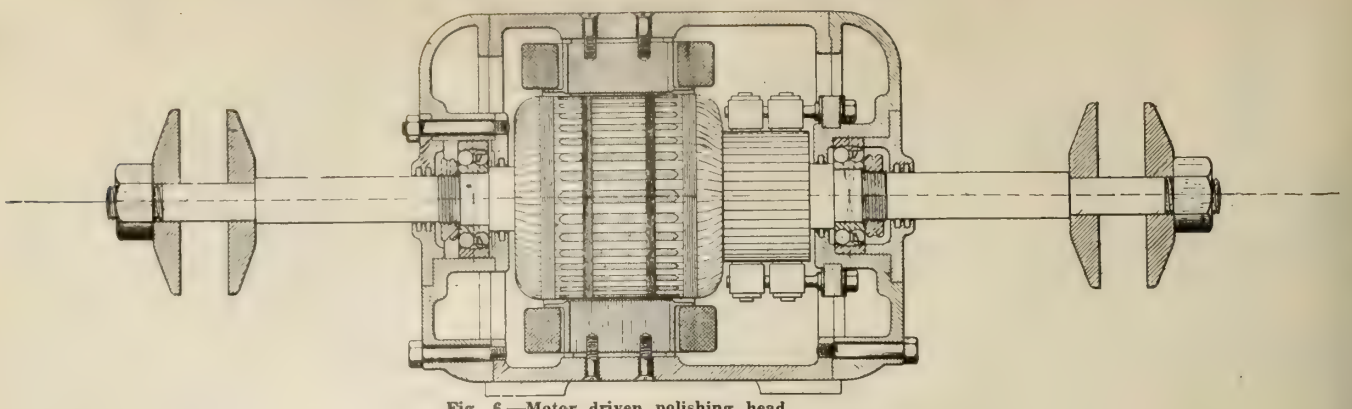

Fig. 6.—Motor driven polishing head.

against the escape of oil or the intrusion of dust into the bearing housing. There is no lost power in slipping belts, there being less resistance to overcome. Belts need not be run under such heavy tension.

Everyone in a machine shop is familiar with the chatter and vibration from the plain floor grinder, after the bearings have worn slightly, and it is interesting to see how far this is tolerated by the men who use it; in fact it seems to be tacitly understood that nothing short of a burst wheel or a vibration which makes it impossible to hold a tool against the wheel, will induce anyone to repair the bearings. All this means waste of power, time and poor work. There is no reason why a grinder should not run as smoothly and with as little trouble as an electric motor, which is easily accomplished by a trouble proof machine properly made in the first instance and equipped with bearings which are free from initial clearance and wear from sliding friction. Grit from grinding wheels, shop dust and other abrasive substances which in plain bearings cause wear on journal and shaft, cannot possibly intrude into a ball bearing housing properly designed. Lubrication is needed only at infrequent intervals, consequently they require less oil and attention. Oil rings are unnecessary. There is no binding, no failure of lubricant, no heating and no stoppage for repairs.

The foregoing explanation of advantages to be gained by the use of ball bearings on the simplest machine in the average machine shop. "The Floor Grinder," and the actual saving in the first cost made possible, should certainly lead designers of machine tools to examine their present viewpoint in the light of developments taking place in such specialties as covered by this article. We are all too easily misled by the idea firmly held by the average purchasing agent—"what is the price?" and even machine designers, in many cases, are skeptical when you can cheapen a machine by using a high grade article in its construction, which is done in a great many cases, for instance the lowest priced, as well as the best.

For its work, "the Dumore," with which we are all familiar, was made possible by the use of a high grade bearing, in other words, it was not possible to construct such a machine to work at 32,000 r.p.m. until the ball bearing had been developed to its present day efficiency. Figs. 7, 8 and 9 show three distinct types of applications for precision machines. The first, is a vertical surface grinder, all the pressure from the wheel and weight of the spindle, being taken on ball thrust bearings, the taper bronze bearing being used to secure easy adjustment. The high speed

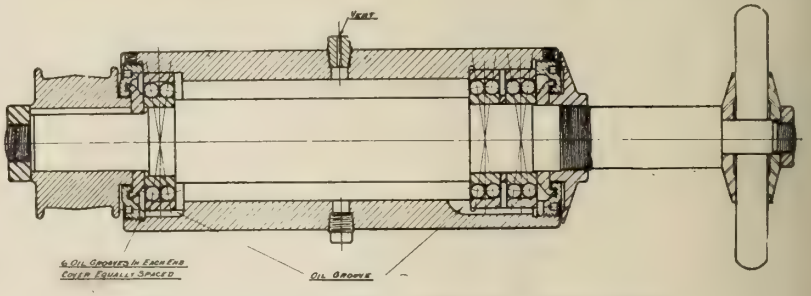

Fig. 8.—High speed precision spindle with take-up feature.

application shown in Fig. 8, is one where extreme accuracy of grinding is essential and where a small wheel necessitates a high speed of rotation. The two bearings at the wheel end, are adjustable against each other, in order to prevent even the finest amount of play that might develop. The design shown in Fig. 9 is one developed in the ball bearing factories, and is used for grinding the raceways, where accuracy of

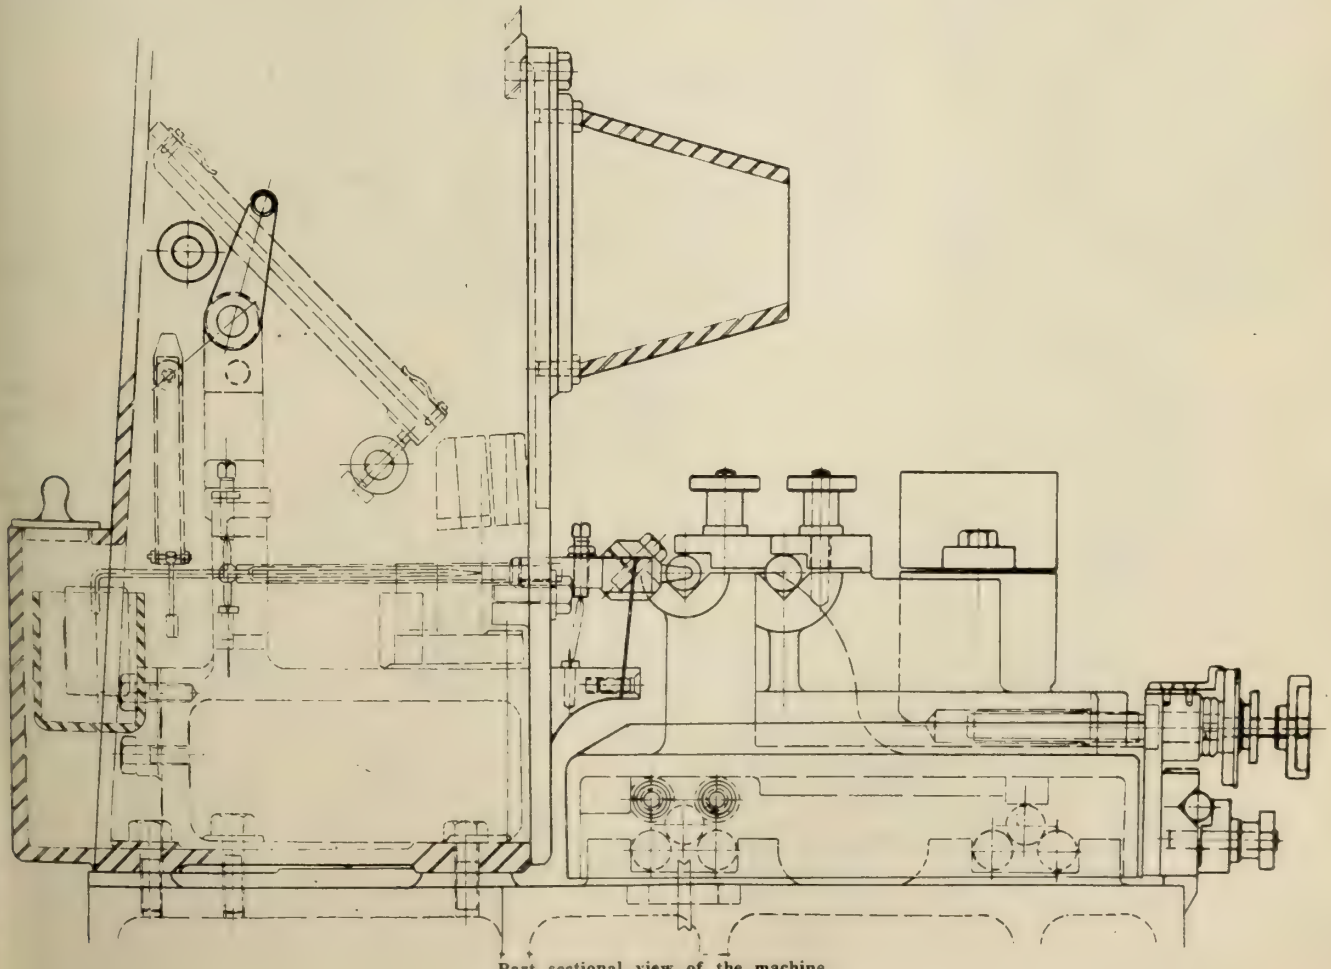
The Need of Gauging for Modern Manufacturing

Continuation of Previous Article—Limits in the Tapped Hole—Go and Not Go Gauges—Measuring Machines Past and Present —Definite Limit of Microscopic Magnification



By A. C. WICKMAN B. Sc.

IN the former portion of this article, which appeared in the Sept. 29th issue, we discussed the gauging problem up to the point of describing a certain class of snap gauge. Let us next look after the limits in the tapped hole. This is best accomplished by using a screw plug gauge of a double-ended type, one end being to the full form of the particular thread in use, while the other end is formed so as to test the effective diameter only, its size being larger than nominal by the limit which can be allowed for proper working. We now have a system for screws which has been in use for plain shafts and holes for some considerable time, viz., that called the "Standard Hole System." We keep our tapped hole a standard, i.e., we make it pass the "Go" and "Not-go" screw gauge, and, for different qualities of work in the same way as we make an allowance on the shaft for different kinds of running-fits, push-fits and driving-fits, we can make an allowance with the adjustable thread snap gauge and turn out screws of any quality we like without sacrificing interchangeability in the least way. The absurdity of having "Go" and "Not-go" gauges of the full form type is shown by the following:

I came across a firm some little time ago who were producing brass water cocks, the thread of which was specified to be within standard size and plus .002 inches. The gauges that were supplied to them for this work were both of the full form type, merely different in size by the limit. Therefore, it would have been possible to have completely turned all the threads out of the hole and still pass the gauges. Obviously if a proper "Not-go" effective-only gauge had been used they would have found that the limit allowed would have necessitated making the article in the tool-room and not in the shop. On the particular thread they were producing they could easily have had a limit on the minimum effective diameter of up to .012 in., and still be producing a better article than the one which would pass their gauges.

This system opens out a very large field indeed in the production of screws, and seems, so far, from all evidence we have, to be the first practical system that has been evolved. The gauge can also be used to great advantage in the inspection of taps and it is clear that a large amount of research work is still open, both for tap manufacturers and tap users, as to what limits of accuracy a tap can be commercially produced. We have shown how essential it is to have a periodical inspection of gauges, and it will be obvious that such a periodical inspection should be carried out at a minimum cost with a maximum accuracy.

Measuring machines of past years have suffered from several defects. Firstly, they were designed with an idea of time being no object, also they were limited to the comparison of such things as plain length and diameters, and in the few cases where attachments were supplied for examining the various elements of screw gauges the method used was that of microscopic examination, the magnification being extremely low, about 25 to 1, so that the process was not only slow, but by no means ac-

Part sectional view of the machine.

curate enough for the inspection of the highest class of reference gauge.

It is true that six figure measurements were obtained, but due to the fact that these machines relied on the personal elements of the measurer to produce the given result, repeat readings by the same person and by different persons did not agree, even to the fourth figure. Also machines required such delicate handling that the system of measurement was looked upon as a laboratory experiment rather than a necessary tool room process.

It will be as well to point out, that there is a vast difference between obtaining a measurement, and that of obtaining a size. A measurement in itself means no more than a reading of a certain number of figures, and the number of figures that can be read depends only and solely upon the size of the graduated dial from which they are taken; but when we have to deal with actual size, a totally different problem confronts us.

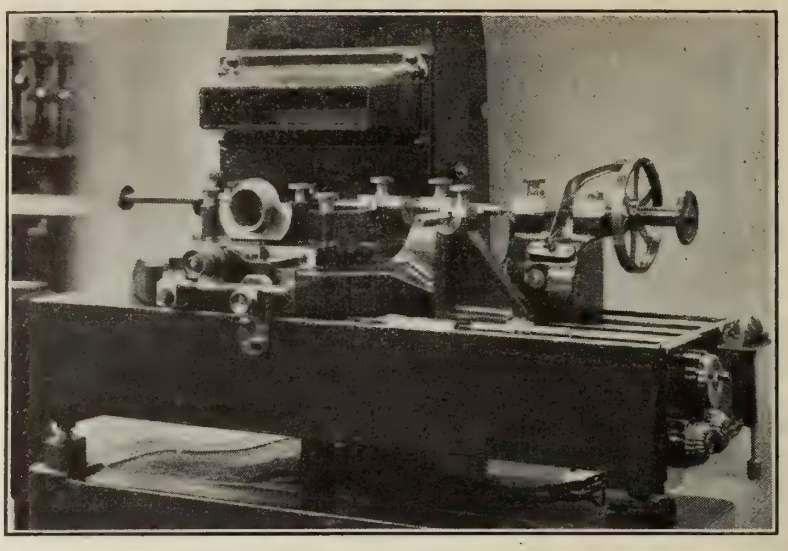
The Definite Limit.

In the first case we must have a machine whose magnification is so large that no operator, however unskilled, could vary in his or her estimate of the period at which movement of the micrometer wheel shall cease and a reading be taken. Now there is a definite limit to which miscroscopic magnification can be taken, due firstly to the loss of illumination and secondly the extremely low focal length which becomes necessary. Also such an instrument is very sensitive to vibration, and in most buildings wherein machinery is in motion, the field would be entirely blurred.

If we make our magnification a mechanical one, the first thing that happens is that however we carry out this magnification, the movement of the last lever will have a certain amount of stickiness, and this will be multiplied by the leverage of the mechanism. This will cause considerable residual strain to be left in the mechanism, and when such an instrument is set to zero and tapped with a pencil, the last lever will move from the zero mark as the residual strain in the mechanism is released by the vibrations set up by the tappings. The speed of the last lever will also be very high, and considerable overthrow will occur on the points of reversal of its motion, the mechanism will also be easily affected by vibration, and would necessitate it being mounted on a concrete base in a building entirely removed from any outside disturbing influence.

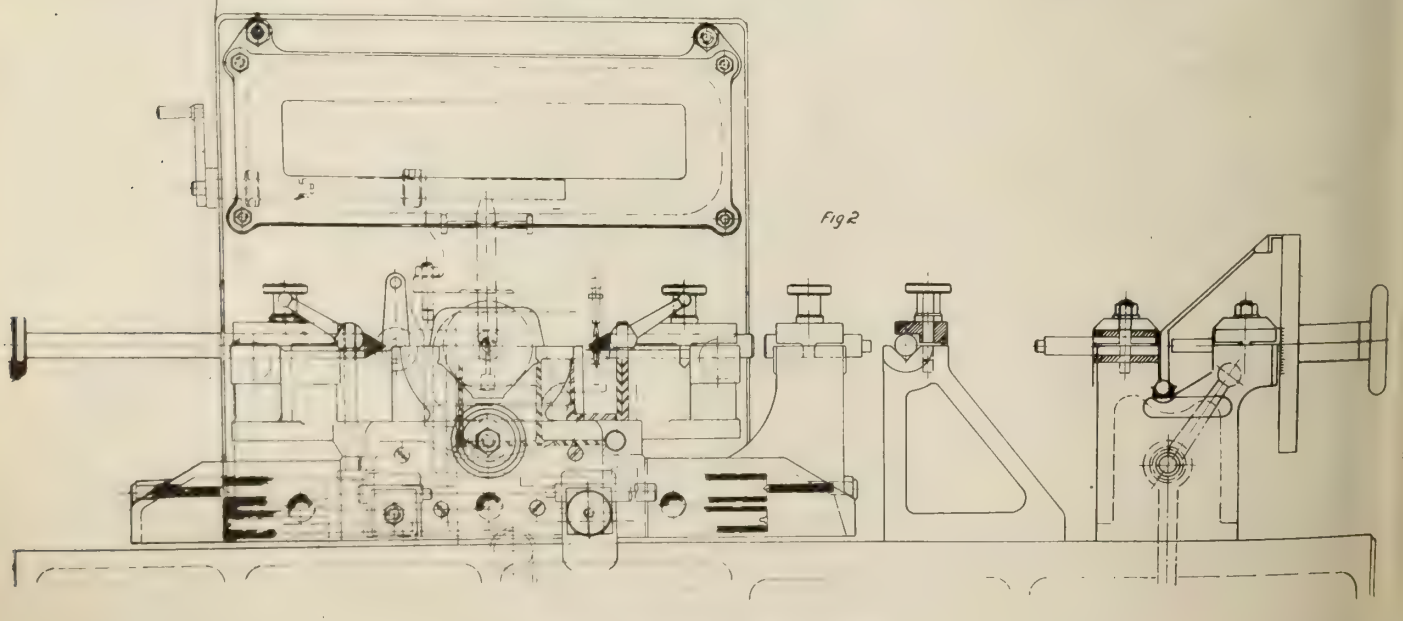
Up till a few years ago the line standard was considered to be the acme of perfection, and this of course necessitated the use of machines with microscopic magnification. This is entirely due to the fact that no one had ever dreamed of the possibility of producing end standards to any degree of perfection. We are now, however, able to produce end standards to an accuracy far greater than that of any line standard of measurement, and when properly used they are practically everlasting, and for all measurements less than say 3 feet, are infinitely preferable to the line standard.

From these remarks it would seem that the kind of machine which is required for accurate tool room measurement should have the following properties:



(1)—It should require no special building but could be put down in the tool room near to moving machinery. In order to accomplish this the machine must not be affected by vibration and therefore its amplifying mechanism should have practically no residual strain.

(2)—It should be quick of operation.



(3)—Its accuracy should be entirely independent of the operator.

(4)—Every measurement on it should emanate from some fundamental standard.

(5)—Its accuracy should be unaffected by changes in temperature.

Photograph showing the machine in actual use.

A view of the machine from the front.

(6)—Its anvil pressure should be as light as possible.

(7)—Its measurements should take in not only plain length and diameters, but also the pitch of screws, internal and external, also internal diameters, both screwed and plain.

Large Magnification

The machine shown in Figs. 1 and 2 was specially designed to fill this want, and like most things which are designed, was the outcome of absolute necessity. In this machine the magnification is 4000 to 1, and is carried out by a combination of mechanical and optical means, the mechanical being 60 to 1 and the optical approximately 70 to 1. The low mechanical magnification entirely overcomes the trouble of residual strain, and also enables the machine to be operated extremely rapidly, as the speed of the second lever is never excessive, and being made of duralumin is extremely light, so that no overthrow occurs at the point of reversal.

The stylus point shown, is mounted upon a flexible steel strip, which can bend backwards and forwards and be twisted torsionally, but is tremendously strong transversely.

To measure the pitch of a screw, thread by thread, a stylus is chosen so that the end approximately touches the effective diameter of the gauge mounted between the centres, and the top carriage is advanced by the screw until the stylus presses into the thread. The stylus on entering will slide down one flank of the screw, and on rotating the micrometer wheel and pushing the carriage carrying the gauge along, it will travel down the flank of the thread until it locates on the effective diameter touching both flanks.

While it has been travelling down the flank of the thread, the steel strip has been twisted torsionally, due to the side pressure on the stylus, and on continued rotation of the micrometer wheel, the strip will straighten itself and commence to twist in the other direction until not being able to twist any further, it will ride out of the thread over the top of the crest, rock over, slide down the next flank of the screw until it again engages with both flanks.

Now, at some time or other during its travel, the stylus will be in engagement with the effective diameter perfectly central, that is, there will be no torsion in the steel strip. The torsion of the strip is transferred into an angular motion of the second lever multiplied 60 times, this second lever carries on its extremity a square frame containing a hair line. This hair line and frame is in a parallel beam of light coming from a "Pointolite" lamp through a condenser lens, and immediately above the hair line is a projection lens of approximately 1 inch focal length, so arranged that the shadow of the hair line is projected upwards on to a mirror at the top of the chimney-like looking structure, back again to a mirror at 45 degrees, and out on to a piece of ground glass where it appears as a black band, approximately 1/10 inch width. In the centre of this illuminated scale, are two lines drawn so that the black band can be accurately positioned between them.

The mechanism is so arranged that when, as before mentioned, the stylus is in engagement with both flanks of the screw, and the strip has no torsion, the black band is placed between the two black lines on the lighted scale, and it is in this position that a reading of the micrometer wheel is taken. If we now traverse the carriage by means of a micrometer screw, so that first of all the steel strip twists to its limit, and the stylus then climbs up the flank of the thread over the crest down the other flank, when the black band is once more between the two black lines, we shall know that we are in exactly the same position in the next thread that we were in the last, and another reading of the micrometer wheel will tell us the error of pitch of that thread. This process is continued for the complete length of the gauge, and some idea of the rapidity of the measurement can be gathered from the fact that ten readings can usually be taken in less than two minutes.

The levers have a number of vanes dipping into oil dash pots, which make the complete mechanism very dead beat, and absolutely free from vibration. That residual strain is entirely eliminated is shown by the fact that on the machine being set to zero the bed can be hit anywhere as hard as possible with the fist, the shadow of the hair line being vibrated out of position and afterwards settling down absolutely to zero again. This kind of treatment is impossible with the usual type and this enables the machine to be put down in the tool room amongst machinery in motion, where it is not affected by the various vibrations which occur in the average works.

The main carriage has a movement of approximately 4 inches, and as it weighs with its centres something over 75 lbs, a special way had to be designed so that friction was reduced to a minimum, and the anvil pressure made as light as possible. The carriage is mounted on a patented way which consists of four hardened ground and lapped steel rollers, which extend the whole length of the carriage. Two of these being positioned in the bed and two in the carriage, they are so placed that the points of contact of the hardened steel balls which run between them make a guiding vee of 60 degrees. The balls are positioned in three groups of three. These four rollers make the two guiding points, the third point is composed of two smaller rollers positioned in the bed, the three steel balls running on a hardened ground and lapped flat steel strip which is positioned in the carriage, this making an ideal vee and flat carriage movement.

The ends of the rollers are easily measured for parallelism, and equality of height, the result being a motion which is free from sliding friction and which is extremely accurate. Some idea of the perfectness of this way will be given by the fact that the top carriage, which weighs, complete with its equipment, some 75 lbs., is easily started from rest and continued in motion by the pull of a piece of cotton running over a pulley carrying a weight of 1½ ozs. This has the effect of making the anvil pressure exceptionally light and so obviates distortion when measuring delicate objects such as N.P.L. needles.

The Bed Casting

The simplicity of the casting for the main bed will be seen, the top being scarcely machined at all, except just in the raised abutments which carry the rollers. The scale has not been broken across the bed, thus eliminating the period of seasoning which is so essential with all other measuring machines, as it is quite immaterial to the accuracy of the machine if the bed does warp within certain limits, but these limits are well within manufacturing possibilities. In spite of this the bed is heat treated or artificially aged before final machining.

For taking ordinary length or diameter measurements, we place between the centres what is known as an engaging member, this consisting of a piece of steel with an annular vee groove in it, into which the stylus engages in the same manner as it does in the thread. When the stylus is thus engaged, the movement of the main carriage, because it twists the steel strip, is magnified 4000 times by the movement of the shadow of the hair line shown on the lighted scale.

Suppose we wish to measure a length of 6 inch. We set the standard between the anvils and arrange the machine so that the shadow is between the two black lines on the scale; this need not be done to any great degree of accuracy, as ½ inch of movement of the shadow is equal only to .0001 inch, approximately of the movement of the carriage. A reading is now taken of the micrometer wheel, and the stop anvil, situated in front of the carriage, is set with a slight clearance. This stop anvil prevents the carriage from running in and closing up the gap. The 6 inch gauge is now placed between the anvils and the micrometer wheel turned until the shadow of the hair line is once more between the two black lines on the scale. Another reading of the micrometer wheel is taken, then the difference between our two micrometer readings is the difference between the known standard and the length of the gauge.

Referring again to our measurement of pitch. In most machines that exist at present for the measurement of this element which, as we have seen before, hand, is the most important one in the screw, another difficulty has to be faced In ordinary comparative measurements such as we have just made, we merely use the micrometer screw to make up the difference between our standard and that of the gauge we are measur-

ing, which never need be more than a few thousandths of an inch, therefore, any inaccuracy in the micrometer screw is negligible. But when we make a pitch measurement we have to use the full length of the micrometer screw in order to push the gauge past the stylus point and in this case our micrometer screw is our standard of comparison, and therefore it is quite useless having a machine which will measure pitch to 5 decimal places if the micrometer screw is not accurate to four.

Calibrating Screw

We have, however, a means of calibrating our screw against our reference standards in a manner which never need take more than two or three minutes. The method is as follows: The engaging member is placed between the centres as before and engaged with the stylus point. The machine is so set that the micrometer reads zero when the shadow is in position on the scale. Again adjust the stop anvil to a slight clearance and open out the micrometer to say 1/10 inch, the stop anvils will have closed and the shadow will have gone off the scale. Take a 1/10 inch standard, place it between the micrometer anvils, rotate the micrometer screw until the shadow is once more in its place, and if the wheel does not read zero, the difference of reading is the error in the screw.

This can be done in any steps up to the complete length of the screw, and on any progressive error being found a steel strip upon which the vernier arm runs, can be taken off and surface ground to any inclination so that as the vernier arm moves along it, it adds to or subtracts from the length of the screw, thus compensating for any error which may arise.

The micrometer has a hardened screw and nut, and is calibrated in the first place, but in course of time a progressive error is bound to wear into it, periodics tending to diminish as wear takes place. In this way it will be seen that our pitch readings can be referred to our fundamental standards. The anvil pressure of the machine is 1½lbs., and is obtained by means of a dead weight running in an oil dash pot. This means that the anvil pressure is constant for any position of the carriage. The weight also has a valve in it which allows the carriage to be moved outwards quickly, thus opening the anvils, but on releasing same and allowing the weight to drop the valve shuts and the weight can only drop down the dash pot according to the creeping of the oil through the valves. This obviates any possibility of damage due to the carriage being released and charging into the micrometer anvil.

For the measurement of internal pitch an attachment is provided which transfers the movement of the stylus point through a right-angle, and the ring gauge is mounted in the line of the centres, the operation being exactly similar to that of a plug gauge. For the internal measurement of ring gauges, the gauge is mounted on a mandrel, which is slotted to allow the stylus to engage the threads and has a standard size shank located in the central vee piece of the top carriage. Special stylus points are provided for measuring the major, core and effective diameters, the effective diameter stylus points varying with every pitch in the same way as needles do for measuring external effective diameters.

WHAT IS THE MONEY VALUE?

(Continued from page 27)

As to the length; setting the cutters by spacing collars to a length gauge held between the cutters would be all right if the arbor were true, the collars parallel, the cutters a neat fit on the arbor, and the cutter teeth ground square with the bore. In actual practice there is always some wobble to cutters so strong on an arbor, causing the cutters to cut a shorter piece than intended—this inaccuracy being in addition to the one which is greater or lesser according to the skill of "feeling" in setting cutters to a gauge. Under such every day conditions, it is necessary to cut and try, using dummies or previously spoiled pices for the process.

The pieces are of cast iron and this, coupled with a glance at the cross section, will tell the experienced man something that the novice would not suspect. The length is 13 inches, that of the miller vise probably used is 6 in. or 7 in. at the most, giving the pieces an overhang of over 3 in. at each side of the vise and at this extreme length the piece is caused to resist the stress of the cut. The last piece in the load is sure to be broken unless the feed is reduced to the most extravagant nibble. By placing a piece of steel in the vise, next the movable jaw, and further stiffening the set-up with two clamps to bind the steel and two work pieces into a more non-vibrating whole, the cut may be made at the highest feed and in perfect safety. The drawing shows this point.

Summing up, the experienced man took about an hour longer in making his trial cuts and in collecting his supplies than did the inexperienced one but he made this up when he got to cutting because he could use coarser feeds and he did not have to stop for broken pieces blocking the machine. And the preliminary time resulted in twenty-five good pieces at the end of the run instead of twenty out of square and varying in size besides the five that were broken.

The above is a case from an actual performance. The job itself is one of the simplest cases of shop practice that could be given—one that seemingly calls for a minimum of experience but actually calls for a great deal. In the shop where this was done, the job was given to a workman who had a smattering of shop practice and he broke or spoiled several castings before his real ignorance of so simple a task was discovered—the delay while new pieces were being obtained to fill the order cost the customer over $150, since he had promised certain work and based his promise on the machine shop's getting the castings to him.

BALL BEARINGS AS ADAPTED IN GRINDER

(Continued from page 30)

size and surface finish are very exacting.

The spindle is mounted on three bearings, two of which are adjustable against each other, and the third merely a carrying member. The driving pulley is carried on two radial bearings and transmits the power to the spindle through a series of keys. This arrangement is to prevent vibration from the belt being transmitted to the spindle and wheel.

DUST HAZARD TO BE CONSIDERED

Further attempts are being made to lower the present dust hazard in grain elevators. Canadian Government officials have asked the United States Dept. of Agriculture for aid in this research work and on the invitation of J. Grove Smith, Dominion Fire Commissioner, the latter department sent D. J. Price, engineer in charge of the office of development work of the Bureau of Chemistry, to hold a conference at Ottawa, September 30th, on the causes of dust explosions and methods of construction and management of elevators to prevent their occurrence.

The United States engineers previously had been called in by the ruins of the disastrous elevator explosion at Port Colborne, Ont., and to look over the great elevators at Fort William and Port Arthur. Engineer Price recently addressed a conference in Montreal similar to that to be held in Ottawa. Lessons will be drawn from the disaster at the Armour elevator in Chicago last March, in which six lives were lost and $4,000,000 worth of property destroyed.

BLASTING BY LIQUID AIR

Liquid air which was produced in Great Britain—as a result of the wonderful experiments of Sir James Dewar—has now became a commercial product. Some experiments of a most successful kind were carried out recently by a British company in the use of liquid air as an explosive. A paper cartridge filled with a material rich in carbon was used, after having been soaked for a quarter of an hour in liquid air containing eight parts in ten of oxygen. Cartridges of this type were charged into the holes to be blasted and were fixed by means of an electric spark. The combination of the oxygen with the carbonaceous material created a sudden and enormous volume of gas with strongly explosive effect.

WHAT OUR READERS THINK AND DO

REGARDING THREAD CUTTING

By Cecil H. Smith

Having read with interest Mr. Davies' article on thread cutting, in the August 25th issue of "Canadian Machinery," let me explain my own particular method of calculating gears. Of course, I believe the following method to be more simple, but let readers be the judge.

First arrange all the gear teeth numbers in fractional form. Place all drivers above the line, and all driven numbers below the line. Consider the number of threads per inch in lead screw as the numerator, and the threads per inch in screw to be cut as the denominator. For example:

Suppose we are cutting a thread 10 per inch with a 4 pitch lead screw. We then have 4/10, the 4 representing the driver and the 10 the driven. Multiply both figures by some number that will bring the total to suit the gears on hand. For example:

$$\frac{4}{10} \times \frac{6}{6} = \frac{24}{60}$$

To compound: To cut 40 thds' per inch with the same lead screw—

$$\frac{4}{40} \times \frac{5}{5} = \frac{20}{200}$$

As 100 would likely be the largest gear we have—

$$\frac{20}{100} \times \frac{1}{2} = \frac{1}{2} \times \frac{40}{40} = \frac{40}{80}$$

The gears would therefore be

$$\frac{20}{100} \text{ and } \frac{40}{80}$$

Another case. To cut 2 4/5 thds' per inch with a 5-pitch lead screw, having no 100-tooth gear, the numbers running in fours:

$$\frac{2\,4/5}{5} \times \frac{5}{5} = \frac{14}{25}$$

$$\frac{25}{14} \times \frac{4}{4} = \frac{10}{56}$$

As we have no 100 gear, and the gears run in fours, we take 4/5 of 100, or

$\frac{80}{56} \left(\frac{5}{4} \times \frac{8}{8}\right) = \frac{40}{32}$ gears then equal

$$\frac{80}{56} \quad \frac{40}{32}$$

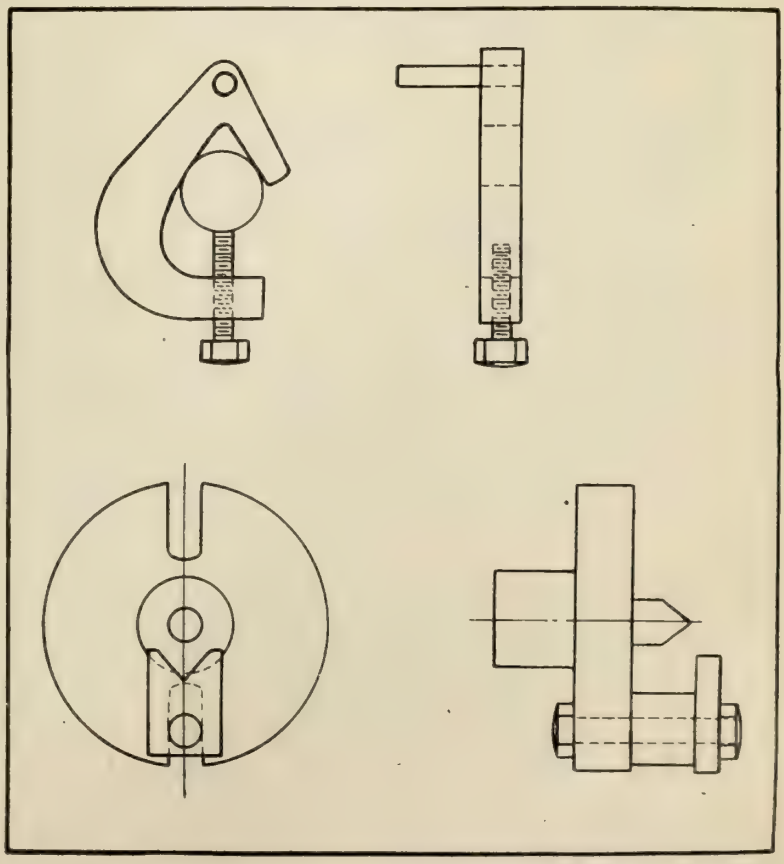
To prove all gears, cancel the gear numbers as you would a fraction, when they should come back to the original. For example: Let us prove the last problem—

$$\frac{80}{56} \times \frac{40}{32} = \frac{5}{7} \times \frac{5}{2} = \frac{25}{14}$$

$$\frac{25}{14} \div \frac{5}{5} = \frac{5}{2\,4/5}$$

The number used to multiply the original fraction to bring it into gear tooth numbers must be selected to suit the gears you have. As a rule 4, 5, 6, or 8 are used. The above explanation in written form may appear complicated, but after use, it is, to my mind, very easily understoood.

TWO HANDY IDEAS



By Harry Moore

The sketch shows an unusual style of lathe dog which was designed for turning the ends of long rods. When working on rods of this nature they can be turned end for end very easily and quickly as the dog can be taken off and put on while the work is between centers.

The other view shows a support in the shape of a Vee piece of flat stock which has an elongated hole in it for adjustment. The support is fastened to the face plate, and the operator merely lays the work on the Vee block which holds it central while he adjusts his tailstock centre to push the work up properly.

NEW BRIDGE

The new Kidderpore Bridge which is now being built in Howrath will be one of the finest road bridges in India. The bridge will be a bow-string truss with a clear span of 237 ft. and an over-all width of about 8 ft. The structure will consist of two main girders spaced 36 ft. wide to accommodate two lines of trains down the centre, and a road for fast and heavy motor traffic on each side of the tramways. On either side, outside the main girders, there will be cantilevered out a roadway for slow traffic 8 ft. wide. Footpaths 10 ft. wide will be supported by the outer ends of these cantilevers.

Showing unusual form of dog and face place support

Black Finish on Brass

FOR the purpose of producing a black finish on small brass articles, says Mechanical World, it has been found that a sulphocyanate solution having the following composition is satisfactory:—Nickel ammonium sulphate, 8-oz. per gallon; zinc sulphate, 1-oz. per gallon; and sodium sulphocyanate, 2-oz. per gallon. It is desirable to keep in suspension an excess of zinc carbonate, which maintains the neutrality and the zinc content of the solution. "Black nickel" plating may be applied successfully to brass, either directly or after copper plating, to copper, and to steel which has been first coated with copper, nickel, or zinc. Where protection against corrosion is desired, the "black nickel" should be preceded by zinc plating. The wearing properties of the "black nickel" surface are largely determined by the quality of the lacquer subsequently applied.

Lighting As An Investment

SPEAKING on the value of proper shop lighting, the National Safety Council states that good lighting is an investment, and not an expense as some would have you believe. They point out that in a plant which is properly illuminated accidents are less frequent; the employees work more efficiently and make fewer mistakes; a closer and better supervision of the men is possible; and the employees are contented and more stable in employment because of the orderly and pleasant surroundings which are sure to result from good lighting.

Adequate daylight illumination, properly applied, they continue, is the ideal light for the eyes. Light from above is generally better than light from side windows only. Skylights and monitor windows should, therefore, be provided wherever possible. Large window areas, equipped when necessary with awnings, window shades or blinds, and diffusive or refractive glass, together with light interiors are desirable in every work place.

The skylights and windows should be so spaced and located that daylight conditions are fairly uniform over the working area. Saw tooth roof construction gives an ideal daylight distribution. The intensities of daylight should be such that artificial light will be required only during those portions of the day when it is naturally considered necessary. Ceilings and upper portions of walls should be kept a light color. The lower portions of the walls may be darker, to rest the eyes.

Machines and work benches should be placed to secure the best light available. Benches at right angles to wall will often be found to improve lighting conditions. Close machine and bench work in centre of room. Machines should be so placed that the light reaches the workman from the side and falls naturally on the work, and that operators, benches and machines interfere as little as possible with the proper distribution of light to others farther from the windows. Lighting is improved by the removal of overhead belting.

Wired glass is recommended for practically all factory and mill windows where prisms are not required. Prism glass is of advantage where the windows are obstructed by buildings, especially if the room is deep. By its use a better distribution of the light over the floor area is possible. Wired glass shou'd be used in all skylights as a safeguard against breakage. Ribbed glass gives better diffusion than plain glass; in vertical windows it should generally be placed with the ribs horizontal, and will then act somewhat like prism glass.

Artificial light is required in factories and shops, on an average, about 20 per cent of the total working hours, not including overtime or night work. Where night work is carried on, the artificial lighting problem must, of course, receive particularly careful consideration. The development of new and improved types of lights, in many sizes, makes it possible however, to secure satisfactory and adequate illumination in any industry and under varying conditions.

Reducing Noise in Factories

IN A recent number of a German technical magazine, says "Scientific American," an engineer named Walter Ritter, has suggested certain methods for reducing the inescapable noise in factories, machine works, mines, etc., to the lowest possible minimum. His basic idea is that it is less important to reduce the actual nose than to check the spread of the vibration to which noise is due, since in his opinion it is such vibrations that chiefly affect the nerves, having a more injurious effect than the pounding of a steam hammer or the buzzing of a motor.

The first law he lays down is that the foundation upon which a piece of machinery is erected must be absolutely solid and resistant to pressure, and he suggests that a suitable material for making such foundations is armored cement or else a masonry of slag set in mortar of pure cement. However, this foundation does not lessen the noise, since each of the two materials suggested is an excellent conductor of sound. One or the other of these materials is essential because of the firmness and solidity, but Mr. Ritter suggests the mixing of the cement with quartz sand and finally broken stones to form a sheet 10 centimeters in thickness as the first layer of the foundation. Upon this are placed successive layers having a slightly different composition, gray lime and kiesselguhr cement, each layer being firmly connected with the one below. The uppermost layer which should be from 10 to 20 centimeters thick, should consist of kiesselguhr cement. A foundation built in this manner possesses the property of deadening sound considerably and also reduces the vibration since the use of the kiesselguhr has the effect of imparting elasticity to the cement.

Vibration is further reduced by means of an insulating material. Rubber might be considered best for this purpose, but rubber does not assist in lessening the noise. The best material for laying under the machine has been found by experiment to be a thick wool felt, the so-called iron felt with an impregnated surface or crust. Such felt exhibits great resistance to pressure combined with a high degree of elasticity. It has been shown by experiment that this felt is not "deformed" by loads up to a pressure of 1450 atmospheres. Such favorable results have been obtained by this method of constructing machine foundations that it is to be expected their use will be rapidly extended.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Out of the many replies received to our October 6th contest, not one was correct. This means that two scales will be given next week in place of one. We have an important announcement to make in this respect. From now on, our scales will be enclosed in a neat case, so that we are thus adding to the value of our weekly prize.

CONTEST FOR OCTOBER 27TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1—How to effect big savings.
2—Something that is saving men's time.
3—How to get over a problem.
4—A product with five features.
5—Something that looks like a pistol.
6—How to secure a cushion—but not a silk one.
7—Something that has been going on for over half a century.
8—A case where complete revision improved something.
9—Something that is quiet, but efficient.
10—A combination you can't beat.
11—Something that is traditional.
12—A product that maintains its goodness

These are Correct Answers for List from October 6th Issue

1—Dominion Steel Products Co.
2—Davis Bournonville Co.
3—Smelting and Refining Co.
4—Morse Chain Co.
5—Aikenhead Hardware Co.
6—E. C. Atkins Co.
7—Shore Instrumnet Co.
8—Geometric Tool Co.
9—A. O. Norton Co.
10—Photostat Corporation.
11—R. A. Hart Mfg. Co.
12—Diamond State Fibre Co.

Closing Date for This Contest is Nov. 17th

DEVELOPMENTS IN SHOP EQUIPMENT

HOT ROLLED DRILLS

The Canadian Detroit Twist Drill Co., Walkerville, Ont., have sent us some literature regarding their double D rolled drill, which, so far, we have never described. These drills are said to be the result of 30 years development, and are made by what is known as the "Hot Rolled" process. This method, according to the makers, produces a product of decided merit, and the high speed steel stock used in the "DD" drill is a high tungsten, high chrome steel, which must conform to special chemical specifications and analysis. The flukes of the drills are formed in straight from the bar stock, and then rolled hot on a machine with special patented feature rolls. This rolling is said to produce a uniform grain throughout, and helps the drill to accomplish severe service. Later the fluted blank is re-heated and twisted in a specially designed automatic machine. The helix angle on these drills is 32 degrees. This is said to help in deep drilling in tough or hard, heat treated material.

TILTING AND ROTARY TABLE

The Pawling & Harnischfezer. Co., Milwaukee, Wis., have placed on the market a new work table which is intended as a means of speeding up work and reducing machine shop costs. This table is for use with floor type boring drilling, and milling machines and is to be known as a universal tilting and rotary table. This accessory makes it possible to carry on machining operations on five sides of a piece and at any angle, with but one set-up.

It has an elevation of 90 degrees, and can be revolved a full 360 degrees at any position, whether flat or elevated. There is a graduated dial conveniently placed to enable the operator to locate the work accurately. The table top is elevated by means of two coarse-pitch spur gear segments driven by means of a worm and pinions; and it is revolved independently by a bevel gear and pinion. One revolution of the ratchet handle revolves the table 30 degrees, and one revolution of the elevating handle elevates the top 2½ degrees. Adjustment along the bed plate parallel to the spindle travel is accomplished by means of a rack and pinion. Tee-slots or table edges are used for locating the work, and the top of the table is provided with a trough to catch cutting compound.

PORTABLE HAND DRILL

A lightweight portable electric hand drill of 3/16 inch capacity with pistol grip, is the latest addition to the line of portable electric drills and grinders manufactured by the Cincinnati, Electrical Tool Co., Cincinnati, Ohio. This new drill is suitable for drilling in steel, brass, aluminum and sheet metal and for automobile body work, car building, window frames, wood boring, etc.

It is said to be simple in construction, and is equipped with universal motor, for use on direct and alternating current of the same voltage. The motor housing, end caps and handle, are made of special strength aluminum, insuring minumum weight. The armature and gear studs are mounted on ball bearings which practically eliminate all friction. Gears are of special analysis high grade steel. The switch is the "Cincinnati" special quick make-and-break type with 50% overload allowance. It is entirely enclosed in the handle and is operated by a trigger conveniently located in the handle.

VERTICAL TYPE WELDER

The American Electric Fusion Corporation, Chicago, have marketed a type V. W. vertical welder which is said to be suitable for either light or heavy work. The machine is box type construction throughout, and all mechanically moving parts are completely enclosed. All high voltage apparatus is also entirely encased, this making for absolute safety. These machines will weld material of any thickness from 2 pieces of No. 30 gauge up to and including 2 pieces of 5/16 in. clean stock. The machines can be operated by hand, foot, or by both at the same time without the necessity of disconnecting either one or the other operating levers. The lower horn of machine is adjustable, and four different throat depths can be obtained. The electrical equipment is all of the latest type, and several features are incorporated.

The Canadian Detroit Twist Drill Co., Ltd., Walkerville, Ont., have issued pamphlets describing their line of double D rolled drills. The construction and proper method of grinding is given together with the story of how this type of drill was developed.

SOME LEADING ARTICLES IN THIS ISSUE

Cutting the Time in Three by Disc Grinding 25

Disc grinding can often reduce cost of operation—Suitable fixtures are important if production is to be increased—Disc grinding scales' bases—Counter tare—Door frame, etc.

Plugging Holes in Cast Iron Surfaces 28

Holes may be plugged in many ways such as filler—Burning—Welding—Mechanical repairs, etc. The best method for each case explained—Sketches showing how to accomplish repairs.

Ball Bearings as Adapted to Grinders 30

Plain shop grinder—Grinding and polishing head applications—Disc grinder—Use of self-aligning ball bearings in housings—Vertical surface grinder application—Precision grinder, spindle, etc.

Need of Gauging for Modern Manufacturing 33

Limits in the tapped hole—Go and not go gauges—Measuring Machines past and present—Definite limit of miscroscopic magnification.

What Our Readers Think and Do 37

Answer to a query regarding thread cutting—Also two handy ideas for the lathe man.

Weekly Engineering Digest 38

How to obtain a black finish on brass—Lighting as an investment—Reducing noise in factories—Each subject suitably reviewed.

Developments in New Equipment 40

The latest in machine tool design is reviewed in this section. It pays to keep in touch with new machines, and the purchasing agent should find this section worth while.

Friction's Greatest Enemy

ON ANOTHER page of the present issue appears an article on ball bearings as applied to buffing and grinding machinery. This only covers a very narrow field of usefulness, but starts one soliloquising on the many benefits which have been derived from the use of such bearings. Before the introduction of this style of bearing, friction was considered a necessary evil, and while very annoying, had to be put up with.

This idea has been rudely shattered, and now we have machines running at exceptionally high speeds and using ball bearings as the friction reducing medium. Friction creates heat, and heat in a fast running bearing invariably spells "trouble." In many cases we should have to reduce the running speed of certain machines if ball bearings were suddenly to become non-existent.

Of course there is no danger of this, for the use of ball bearings is becoming more widespread every day. There is a vast difference between the first ball bearing made and the highly developed and accurate bearings on the market today. Many improvements have been made and accuracy unthought of in the earlier days has been attained.

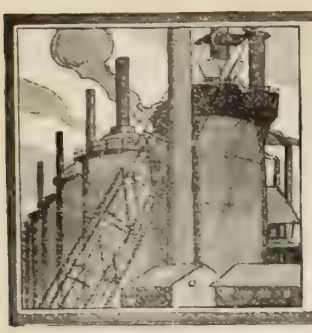
Each change in design has led to still further improvement until we now have balls and bearings that are marvels of accuracy. Industry owes a great deal to the manufacturers of these bearings, and as time goes on the world at large will no doubt still further benefit.

Flying—Is It Safe?

THE AVERAGE person is apt to consider the art of flying a decidedly dangerous one, and while not as safe, perhaps, as walking on terra-firma, it is by no means as bad as it is painted. Apart from the foolish stunts which some aviators persist in perpetrating, the commercial aspect of flying is becoming more rosy every day.

This is evidenced by the following authentic figures which have been issued by the Manufacturers' Aircraft Association, these results covering an aviation survey of the United States during the last six months.

It is stated that 1,200 commercial planes in operation have flown approximately 3,250,000 miles and that out of this number, about 1,000 are under the indirect supervision of responsible plane manufacturers or transportation companies. The remainder are the gypsy or foolhardy flyers some of whom have met with disaster, thus giving the industry, for such it is, a "black eye."



"Eight of the fatalities and thirty-two of the injuries in the last six months have been traced to the lack of terminals, routes and storm warnings, or to reckless stunting—errors which, according to the report, would have been corrected or prevented had there been a national air policy. In all the United States there are only 214 adequate municipal or civilian air ports, yet terminals are as necessary to aerial transport as they are to shipping or the railways. Deducting these preventable casualties, it is found that there was only one death for each 464,285 miles flown and only one injury for each 295,454 miles flown."

It is to be remembered that this record is for the United States alone. Britain has by no means been asleep in the development of commercial flying, and provided the various governments lend their support both by installing terminals, and providing financial aid for further experimental work, there is no reason why the next few years should not see a still further development in this industry. The airplane is invaluable in many cases where speed is the chief consideration, so that anything that will increase the safety of flying should be carefully fostered.

A 60,000 kva. 7000-volt, three-phase generator, rated at 1000 r.p.m., but designed to withstand 50 per cent. increase in speed, has been completed by the Siemens-Schuckert Works in Germany.

Get busy on the woodpile, old man.

MARKET DEVELOPMENTS

Market Situation Varies According to Locality

Production of Steel Ingots is About 35 Per Cent. Capacity—Sheets Have Stiffened Considerably but No Change in Price is Reported —Price of Rails Has Dropped Seven Dollars Per Ton

THE MARKET is very erratic this week. It is largely a question of locality, and reports from the various fields are inclined to conflict with one another. In Pittsburg, the production of steel ingots is around 35 per cent., this being 14 per cent. more than the rate last July. A further increase this year, however, is hardly looked upon as possible.

The sheet mills show the best operation of any branch of the finished steel trade, the rate of production varying all the way from 75 to 90 per cent. Tin mill operations are to 60 per cent. Pipe mills have increased somewhat, the to 60 per cent. Pipe mils have increased somewhat, the average being around 50 per cent.

Rails have dropped in price, the reduction being $7 per ton. This makes the present price $40. It is expected that this drop may cause the U.S. railroads to purchase tonnage now which they would otherwise have carried over into next year.

Finished steel prices in general show a stiffening tendency, although there are no clean cut advances.

It is believed that if freight rates were to come down, business generally would pick up immediately. The steel industry would naturally get its share of the increased activity.

Several good sized orders for rails have been secured by Canadian concerns during the past few days, these being for rails for the C.P.R. and C.N.R. railways. Further business in this market is also said to be within reach

The machine tool market in both Toronto and Montreal markets is very dull. There seem to be lots of prospects, but no actual orders. Some of these prospects should be breaking in the near future.

The small tool market remains fairly steady. Orders keep coming in and although they are for small quantities, in the aggregate they amount to something worth while.

The scrap metal market still remains dull and no improvement is looked for until foundries secure more orders than they have at present.

REDUCTION OF $7 IN PRICE OF RAILS— BUSINESS THIS WEEK NOT QUITE SO BRISK

PITTSBURGH, October 27.—While the production of steel has probably continued to increase up to date, or to within a week or two, the rate of buying of steel products at present does not seem to presage any further increase for the time being. The steel market is distinctly quieter, according to most members of the trade, although here and there mills report orders increasing.

Production of steel ingots is running at [illegible] per cent of capacity, this comparing with rates at 32 per cent. in September, 30 per cent in August, and 21 per cent. in July. There has been a fairly continuous increase in production rate for three months, but the probabilities are there will be no material increase during the remainder of the year and this means of course that there may be some recession. It is quite impossible, however that production should drop to the low rate of last July, for that represented an altogether abnormal condition. There was consumption then, but it was supplied in large part by stocks of steel in the hands of jobbers and manufacturing consumers, and of manufactured wares in various hands. These stocks being largely liquidated, demand upon the steel mills has been returning to a normal relation with the actual consumption, which has been proceeding right along.

The sheet mills continue to show by far the best operation of any branch of the finished steel trade. The American Sheet and Tin Plate Company, (Steel Corporation) has been operating about 90 per cent of its sheet mills, while the independents have been averaging 75 or 80 per cent. There has been a slight decreasing tendency in the past two or three weeks. Tin mill operations have decreased materially, the average being now about 50 per cent. Wire mills are operating at former rates, from 40 to 60 per cent. Pipe mill operations have increased somewhat, and now average close to 50 per cent. Merchant bar mill operations have been increasing, but are still very light.

Shape mill operations are lighter still, although there has been an increase in the past few weeks. In this connection it must be noted that the Bridge Builders' and Structural Society reports September lettings of fabricated steel contracts at 48 per cent. of the shop fabricating capacity, against 33 per cent for August, and an average of 28 per cent for the eight months ending August. Plate mill operations are still lighter than shape mill operation.

It is the low operation of bar, shape, plate and rail mills that pulls down the general average, for it would seem strange for steel to be produced at only about 35 per cent. of capacity when sheet mills are running at 75 per cent and more and wire, pipe and tin plate mills are going at far above 35 per cent.

As to rails, the railroads have not been specifying to any extent of late, and a considerable part of the rail tonnage put under contract for the present year was in line to be carried over to next year, partly because the railroads are short of funds and partly, no doubt, because the roads have lately been hoping that there would be a reduction in the price for next year. The United States Steel Corporation has in the past

few days announced a reduction of $7 a ton, from $47 to $40, in its rail price, and this may cause the railroads to take out some tonnage now which otherwise they would have carried over to next year.

As to finished steel prices in general, they show a stiffening rather than a weakening tendency, but there are no clear cut advances. Efforts are being made, more or less, to get prices up, but this is no easy thing when mills are so indifferently employed. In bars, shapes and plates the advance to $1.65 for bars and $1.75 for shapes and plates still hangs fire. The Carnegie Steel Company got up to this basis several weeks ago, and a few independents are adhering to the prices, but there are a few aggressive sellers at lower prices. These lower sellers have been endeavoring to accumulate enough business to justify their withdrawing the lower prices but it has been very difficult to gather up tonnage, except small orders for immediate shipment. For delivery in the Pittsburgh district and nearby, bars, shapes and plates can be done at $1.60 if the order is attractive in tonnage and specifications, but this is not the market for the whole country, since the usual "Pittsburgh plus" system is abandoned in much of the territory, at least for the time being. Thus there is a seller in the Buffalo district that will name delivered prices equivalent to $1.50, Pittsburgh, on bars, while in the west $1.75, delivered Chicago, has been done on bars. To meet this competition a Pittsburgh mill would have to sell at $1.37, mill, and of course this could not be done.

Just what will occur as to sheet prices remains to be seen. The great majority of independents have formally announced an advance of $5 a ton, but some would probably sell at the old price, and the Steel Corporation has made no advance. If the advance were effective it would raise black sheets from $3.00 to $3.25 and galvanized from $4.00 to $4.25. Superficially blue annealed sheets would seem to go up from $2.50 to $2.75, but in the actual market it has developed that blue annealed sheets can be bought at the $2.25 price ruling before the September advance was made.

That the steel market has been distinctly less buoyant in the past couple of weeks is now recognized in all quarters. Whether the demand, as a whole, has actually decreased is a question, but it is certain that it has not been increasing as it was a few weeks and more ago. Whether improvement will be resumed in the near future is uncertain. An opinion could be formed if it were definitely known what has arrested the progress of the advance. If it is the season of the year, then no further improvement can be counted on until the late winter. If it is the fact of freight rate reductions having come into nearer prospect, then a decided improvement in buying can reasonably be expected when freight rates are reduced. A general reduction would decrease somewhat the cost of producing steel, resulting in somewhat more attractive prices, while it would reduce the cost of moving steel, and that would reduce the cost to the consumer, for whatever the formal terms in a sale of steel the essence of the transaction is that the buyer stands the freight. If half of what has been said lately is true a reduction in freight rates would stimulate business in general, and the steel industry would naturally get its share.

POINTS IN WEEK'S MARKETING NOTES

Production of steel ingots is running at a trifle above 35 per cent. of capacity, this comparing with rates of 32 per cent. in September; 30 per cent. in August, and 21 per cent. in July. However, no further material increase is expected this year.

Sheet metals are fairly strong this week. The rate of production varies from 60 to 90 per cent. Tin mills are operating at about 50, wire mills at 40 to 60, and pipe mills around 50 per cent.

Rail prices are down somewhat, a reduction of $7 having been made a few days ago. This makes the new price $40. This movement may cause the railways to take out some tonnage now, which otherwise they would have carried over to next year.

Finished steel prices show a stiffening tendency, but there are no clear cut advances. Efforts are being made to get prices up, but with the mills running at their present rate, no immediate change is expected.

The steed market is less buoyant. Some think that if a reduction in freight rates took place, it would stimulate business in general, and of course the steel industry would get its share of the increased activity.

Several large orders have been placed with Canadian mills for steel rails during the past few days. It is rumored that there is still further business in this line, naturally the mills who have already landed orders, are going out after the rest of the business.

Sheets and plates continue to be active, both in the Toronto and Montreal markets. However this demand is not expected to continue after the weather gets too cold for building operations.

The machine tool trade shows little change this week. While business is being secured, the orders are few and far between, and are not of very large proportions.

The least said about the scrap metal market the better. Nobody wants to buy, and until foundries pick up, which will not be in the immediate future, no change can be expected in this market.

SHEETS ARE STIFFER MACHINE TOOLS DULL

TORONTO:—October 27th. Gathering up news on the market situation these days is no sinecure. The chief difficulty is to strike a fair average in the various lines. One man may be filled with enthusiasm, while his next door neighbor feels that all is lost. It's a very peculiar situation, and as week after week goes by, the same state of affairs seems to hold good. For example, we were speaking to one dealer this week, who was sure things had gone to the dogs, when suddenly, out popped a fairly good order from the envelope he was opening. Immediately the man's personality changed. Excusing himself, he proceeded to hurry things along, (for as usual it was an order that was held to the last minute, before being placed). We waited patiently, for we had a hunch what this fellow's attitude would be when he came back to his desk, and we wanted to prove our hunch. As expected he was full of pep and enthusiasm when he returned. "You know," he commenced, "when an order like that comes in, I begin to feel that things are not as bad as we picture them when we're feeling blue. Things cannot have gone all to the dogs, for Canada is a big country, with a big future. It may take time to recover, but recover we will."

This story about sizes up the general business situation. Every dealer is very much like an elevator, he is continually going up and down, depending on the traffic he is securing. The chief point of interest is, that once you back them into a corner, and ask them what they think of the future, they invariably say, "It's bound to be good, for Canada is a wonderful country." They have different ways of putting it, but in every case, they feel the same way about it.

The Steel Market

Sheets have stiffened in the local markets, and while no advance in price has been made, the demand for this commodity is very brisk. This is largely due to the fact that many buildings are reaching the finishing stages, and of course everybody is rushing the work through before the cold weather sets in. The number of tinsmiths needed, and advertised for, shows that this explanation is the correct one, for not only are sheets in demand, but also the men to put them in place.

Apart from this section, the steel situation is practically the same as last week. Orders come in steadily, but are not of sufficient importance to talk about.

Speaking on the possibility of a railroad strike in United States, one dealer said that while it would make a difference for the time being, they thought they could pull through without difficulty. "We have a fairly good stock on hand," he said, "and what we actually require we feel we could get through in some way." Should such a strike take place, it would have a tendency to stif-

fen prices, that is, for the duration of the strike. However, as the prospects for a settlement look somewhat brighter this week, we will hope that no emergency measures are necessary.

Machine Tool Market

Reports are very conflicting in this market. One dealer says things are better, while another tells you the very opposite. For example here are two reports as we received them. "We have had a splendid week. In fact the last two weeks have shown a considerable improvement. Our machine tools are selling fairly well, and our general supply line is moving along nicely. There is no change in prices, nor is there likely to be any."

Now comes the other side: "This is the poorest week we have had yet, although we cannot say we have lost hope or faith in Canada as a market for machine tools. We know the need is there, but our difficulty is to get the men who require the tools to spend the money." This about sums up the situation. Every dealer speaks about the prospects he has on tap, and which he hopes to close shortly. When these deals will materialize no one knows. One dealer was very busy trying to land a large order this morning when we called, and when asked as to the outlook he said, "Good—I think I'll land this order. If I do, it will be the best in months." The finest method of describing this market would be to say that it is very erratic.

Small Tools

This market is about the steadiest of all. While no large orders are being closed, it is the old story that many mickles make a muckle, in other words, many small orders make up for a large one. Dealers in this line are quite satisfied and report a slight improvement every week.

Scrap Metal Market

Until foundries throughout the country pick up, we can expect no great change in this market. From present outlook, we cannot see how foundries are going to increase their activities until the demand for other lines likewise picks up. When one considers that the foundry is really the starting point of many lines, it can be readily understood why the scrap market has remained so dull for such a long period. Nobody wants to buy, and as foundries are fairly well stocked up, things are at a deadlock.

GOOD SIZED ORDERS ARE PLACED BY RAILROADS—PLANTS WILL BE KEPT BUSY

MONTREAL, October 27th: — The general situation in the iron and metal industries for the past week has been devoid of any "thrills" or outstanding features of any kind. The volume of business reported compares very favorably with that of previous weeks which have shown gradual and steady improvements since midsummer. The point which really represents the best symptoms is not that of the slightly increasing volume of business, but of the increasing confidence of the buying public and the consumer in general. For a long while prices have been influenced by various factors described in many ways, such as profiteering, war prices, liquidation, etc., etc. All these conflicting elements created suspicion on the part of a purchaser. It is these disturbing features that are passing and thus enabling the bona-fide manufacturer and jobber to rebuild his business connections. The principal business passing this week is reported in steel rails. Elections have had a certain influence on the whole situation as is usual. The issue of the tariff is of such vital interest to the Canadian iron and steel industries that it is not surprising to know that business is being temporarily neglected to an extent that is greater than usual.

The rise of the Pound Sterling to over $4.30, manufacturers claim, due to the suggested settlement of many international problems at the Washington conference, although these matters seem far removed from domestic business problems, they appear, upon close examination, to be linked up closely with the future of the Canadian manufacturer. One jobber claims that if the suggestion of cancelling the war debts all round, or some similar suggestion is acted upon, that it will have a marvellous and almost magic effect on international commerce. Adverse exchange rates will be reduced and huge sums of money now idle in the U. S. A. will be put to work. Thus, business problems of the world will only be ironed out and settled by co-operative work on the parts of all civilized countries.

The Steel Situation

The Algoma Steel Co. have this week received an order for 32,000 tons of rails from the C. P. R. This amount is in addition to the 25,000 ton order from the same firm some weeks ago. The combined orders are expected to keep the firm busy till the end of the year.

The Dominion Iron & Steel are reported to have received an order from the Canadian National Railways for 20,000 tons of steel rails. Rumors on the street are the authority for stating that the National Railways are in the market for some 55,000 tons of rails in addition, and both the Dominion and Algoma firms are making every effort to secure the balance of the order.

Structural steel, and bars of all kinds are rather quiet. Only small hand to mouth orders are being received. Sheets and plates still continue to be comparatively active, and prices have remained steady. The call for sheets has been caused by the usual autumn demand and no doubt business will fall off a little toward the end of the year. The orders in plates seem to have come from a better turn in the shops where a fair amount of tank work is being done.

Prices have remained steady throughout, but there has been a hint for some weeks past that an upward revision would come through at an early date. It is, however, only reasonable to suppose that such is the case, as present prices are approximately production cost, or only slightly better.

Pig Iron

Foundries, except in few instances, report little or no change in business conditions. In some cases stocks purchased some time ago are still unused. Some foundries found themselves so overstocked after the business depression overtook them, that they disposed of their surplus pig. However, the present weekly sales are considerably in excess of those of the first six months of the present year. Pig iron after several advances has reached a point where there is a small profit in it for the producer. These prices are not, however, on a really satisfactory basis yet. Further increases will be in order before normal conditions are approached.

Machine Tools and Supplies

The industrial corporations are only working to partial capacity, and their machine tool equipment is more than ample to take care of present production. Only in few instances are the larger manufacturers purchasing machines. A few odd sales of various tools, are reported, but the purchaser is usually a small shop man. The railway shops have not yet entered the market. One machine tool dealer thinks that Sir Joseph Flavelle's report on the National Railways sizes up the situation correctly, and does not look for business from that quarter for a long time.

The small tool and supply business is continuing on a fairly active basis. The volume of business is slowly increasing. Manufacturers are gradually getting back to normal and prices are becoming more stabilized. Nothing of an outstanding nature however, has been reported for several weeks.

Practically no change in price has occurred during the past week in non-ferrous metals. Copper seems to hold its own, and have a tendency to strengthen in price. Tin is up one cent a pound. Trading for the week has been normal with little suggestion of a change in conditions. Stagnation still prevails in all kinds of scrap metals. The continued operation of the foundries at partial capacity and a plentiful supply of scrap in and around all shops has reduced the trading in scrap to almost nothing. Very few hopeful signs of an early improvement are in evidence and the prices continue at the low level.

The Stroberg Electric Co., Chicago, Ill., have published a bulletin, No. 214, which covers their process timing and signalling instrument No. 55. It explains that this device is used where the element of time is an important factor. The details of construction, etc., etc., are given.

SELECTED MARKET QUOTATIONS

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

The Imperial Steel and Wire Co., opened up in Collingwood on the 17th of the present month.

Installation of an artificial ice plant to cost $50,000 is contemplated by Chatham Crystal Ice Company.

The Peck Rolling Mills, Montreal, are equipping to manufacture angle iron and similar structural shapes.

The Government has announced its intention of re-employing all the railroad employees who have been laid off in the last six months.

M. J. Schmitt, sales engineer, Kearney & Trecker Co., Milwaukee, visited their Ontario Agents, The F. F. Barber Machinery Co., of Toronto, last week.

The Wonder Tractor of Canada, Ltd., of Montreal, Que., has been incorporated with $90,000 capital to manufacture agricultural implements.

The F. F. Barber Machinery Co., Toronto, have just secured the Ontario Agency for the Landis Tool Co., Waynesboro, Pa.

A contract for $82,000 for Indiana Limestone required for a hospital costing $2,500,000, for Ottawa, Ontario has been awarded.

The Canadian Irrigation, Ltd., Toronto, Ont., has been incorporated with $50,000 capital to manufacture irrigation machinery.

Kitchener, Ontario, is to erect a new collegiate institute. So far no cost has been stated, but we believe these figures will amount to something very substantial.

Montreal, Que. The Union Bag and Paper Corporation is now running at 100 per cent. capacity in all its plants, including St. Maurice Paper Co. This activity is on current orders, nothing being made for stock.

London, Ontario, is trying to raise $250,000 by issuing of debentures to enable the Western University to proceed with their new Art Building. It is expected that the approximate cost of this building will be $1,000,000.

Mr. E. W. Beatty, president of the Canadian Pacific Railway, interviewed on his Western tour when reaching Winnipeg, predicted a gradual return to prosperity in Canada and affirmed his faith in the soundness of the country.

The Forsyth Production, Ltd., Waterloo, is planning the erection of a large addition to their factory.

Peerless Machine Co., Racine, Wis., have announced a reduction in prices of their saws, this becoming effective October 20th.

Galt, Ont.—Men are busy at work erecting the new public utilities building which, with equipment, will cost about $200,000.

Fraser Brace Co., Cote St. Paul, Montreal, recently secured a contract totaling $10,000,000 for water power development in Winnipeg.

Thos. Lord, sales engineer for Gould Eberhardt, Newark, N. J., was in Toronto last week visiting their Ontario Agents, the F. F. Barber Machinery Co.

Vancouver, B. C.—The Burrard dry dock company has been incorporated, and a new dry dock may be built in the near future. The cost of the proposed structure will be about $2,500,000.

Bramson's Auto Service, Ltd., are erecting a large six story garage, in Montreal. It is understood however, that they will not purchase equipment for their repair work until after the first of the year.

The Skelton Tool Co., Syracuse, N.Y., makers of boring tools have amalgamated with the Chapin and Baker Manufacturing Co., Inc., of that city, makers of counter boring, spot facing and gear blocking machinery. The name of the new company is The Chapin-Skelton Corporation. New lines will be added.

Cars made at the General Motors plant, Oshawa, Ontario, will be on exhibition at the Olympia Motor Show at London, England. Colonel R. S. McLaughlin, president of the General Motors, is sailing from New York on the Aquitania together with Mrs. McLaughlin to attend this exhibition.

The plant and equipment of the Anthracite Briquette Co., Ashbridge's Bay, Toronto, has been purchased by the Financial Underwriters, Ltd., 88 Bay Street Toronto. The Anthracite Briquette Co., was until a few days ago owned by A. E. Gooderham and associates, and manufactured A.B.C. briquettes Under the new management a briquette made by a Dutch oil process will be produced. Mr. H. F. Clater, president of the Financial Underwriters, Ltd., states that in all probability the newly acquired plant will be added to the assets of the Nukol Fuel Company shortly.

F. E. Bartley, sales engineer, Blanchard Machine Co., Cambridge, Boston, is in Toronto this week calling on their Ontario agents—F. F. Barber Machinery Co.

The Canadian Bridge Co., Walkerville, Ont., have received a contract for steel work on towers for the New Brunswick Electric Power Commission, this commission being situated at St. John, N. B.

Industry on the Canadian Pacific coast is making good headway. In the last fiscal year British Columbia exported goods to the value of $83,558,649 as against imports to the extent of $81,615,288.

The contract for the structural steel works for the new seventeen story addition to the Chateau Frontenac, Quebec, has been awarded to the Dominion Bridge Co., Montreal. 2000 tons of steel will be required for this work.

Sydney, Nova Scotia, reports that a contract for the manufacture of 20,000 tons of steel rails at the Sydney Mills has been signed by the Dominion Steel Corporation and the management of the Canadian National Railways. This order alone will keep the steel plant going for nearly two months.

Burlington, Ont. The Globe Code Standard Electric Co., will soon start up in this town. This new industry will manufacture electric goods of all kinds. The principal line handled will be porcelain insulators, as used in the electric wiring of houses, factories and other buildings, poles, and towers. The factory will employ about 20 persons, to start with, but the number will be gradually increased up to 40.

Lumbering in northern Ontario and Quebec will be carried on during the coming winter on a much larger scale than was expected acording to the latest reports. This favorable change is in many parts of the country where men are being engaged in large numbers. The cause of the revival in activity is due to a large drop in wages. Skilled workers are being employed for $30 a month, while ordinary labor commands $1 per day. This means that lumbering companies are able to cut, and drive logs to their mills for approximately 40 per cent. of the amount paid a year ago. Working efficiency is also said to be increasing, this being due to the big surplus of men and the necessity of working hard in order to hold jobs.

Bridgeburg, Ont. The Canadian Tool Co., have located here. At present they are arranging for temporary factory space, but plan to construct their own plant at a later date.

Figures representing the total amount of contracts awarded in Canada during the month of September, 1921, totaled $19,565,700. $900.000 of this item was used for the erection of factories alone.

The Board of Education, Guelph, Ont., has approved of the plans for the New Collegiate Institute and Technical School. The estimated cost is believed to be $300,00. Construction work in connection with this will start next spring.

The Port Arthur Shipbuilding Co. intends to leave shipbuilding strictly alone for the present at least. They will continue the manufacture of pulp and paper-making machinery, and expect to enter into the manufacture of low pressure boilers for heating purposes.

Owen Sound, Ont. A $4,000,000 cement plant will be established here. This project has been on hand for some time, but now that the government has officially announced their intention to stay out of the cement making game, it is expected that the new plant will be proceeded with immediately.

The large concentrating mill of the American Molybdenite Co., has been opened up at Wilberforce, Ont, This plant so far has cost nearly $100,000, and the first unit, which will turn out 200 tons a day will be started this week. Later on the capacity will be increased to 600 tons a day.

It has been decided subject to certain formalities, to place with a Canadian firm, an order for 36 grain elevators for South Africa. It is understood that part of the machinery will be purchased in Great Britain, but almost the whole cost of the buildings, other than the structural steel to be used therein, will be expended in South Africa.

The Vesta Battery Co., of Chicago are coming into the Canadian field on a large scale. They are building a plant in Sherbrooke, P. Q., which will employ 100 hands for a start. Mr. G. R. Archdeacon, will be general manager, and on the board of directors. Mr. Perry, president of the Vesta Co., is much enthused over the prospects for the Canadian branch.

New plan whereby any person in the United States or Canada can purchase Black and Decker equipment on six months terms, without extra cost. This firm whose products consist principally of electric motor driven shop equipment such as portable electric drills, grinders, etc., have recently put into effect a National Credit Service. These products which are sold entirely through the jobbers, enable users to buy through their regular jobbers by paying 25 per cent. cash and the balance in six equal monthly payments without any extra charge or interest being added to the standard price.

Executive offices have been opened in the Royal Bank Building, Toronto, for the Durant Motors of Canada, Limited. Mr. Mark Daniel has been named as assistant secretary of the Canadian executive.

Plans of the Windsor and Walkerville joint technical school board to build a technical school at a cost of $800,000 have been approved by the Finance Committee, of Windsor City Council. Half of the cost will be borne by the Ontario Government.

The Dodge Sales and Engineering Co., Mishawaka, Ind., have published a very neat brochure, telling the story of "Shorty", and how he came to be portrayed in the form of the now well known statuette. Anyone interested will find it entertaining reading.

Additional contracts for an addition also a new wing to the technical school of Hamilton, Ontario, will cost $70,000. A contract has been let for a separate school costing $60,000. Another contract has also been let for a public school which will cost $300,000.

During the month of September the Canadian Chartered Banks opened 15 new branches and for the same period closed 10 branches. This leaves a net gain of 5 new offices for the month. The figures for the past nine months show that 174 banks have opened branches and 94 branches have been closed, leaving a net gain of 80 branches for the period.

The Kipawa Bleached Sulphite Mills, one of the Riordon plants, which has been closed down for some months in Montreal, has resumed operations with prospects of running on full time for an indefinite period. The market for sulphite has shown considerable improvement during the past few weeks and it is stated that the extreme depression in this particular branch of the trade is a thing of the past.

Mr. G. E. Pearson, one of our Montreal representatives, has been on a two months' trip to England, and reports that there is a most decided improvement in the general tone of business. Everyone seems to have a feeling of confidence, says Mr. Pearson. In fact so much so that they are no longer holding back but are striking out for themselves. For instance he says that the managing director of the Hans Renold Co. of Canada, states that their Canadian office is their only bright spot.

H. C. Cox, president of the Canada Life Assurance Co., has returned to Toronto from an extended tour which took him from Winnipeg to Vancouver. He has brought back a very optimistic report of the West and says that farmers are now buying freely. Business in the cities is also improving, and another encouraging thing, according to Mr. Cox, is the abundance of new building which is being undertaken throughout the entire West. In Regina alone 400 new houses are at present under construction.

C. C. Bradley & Sons, Syracuse, will next year celebrate their 50th anniversary as manufacturers of power hammers. A few days ago they discovered one of their first hammers, made in 1872 still going strong in a Syracuse factory.

The Toronto office of the Independent Pneumatic Tool Co., has been removed from 32 Front St. W, to 163 Dufferin St. This new location will give the company larger space and increased facilities for carying their tools and accessories.

The Algoma Steel Corporation is in receipt of an order for 32,000 tons of steel rails for the Canadian Pacific railway. Some weeks ago the same corporation received an order for 25,000 tons from the C. P. R. The industrial outlook at Sault Ste. Marie is now considered much brighter.

The Red Arrow Tires, Ltd., is a new company to establish its plant in Peterboro, Ontario. Land has been bought and plans for the plant are now being prepared. It is expected that the first unit will be in operation in the spring and that some 400 men mill be employed. The company will be incorporated for $2,000,000.

The Diamond Match Company of the U. S.; The Maguire, Madison Talmer Co., of Canada, who also manufacture matches in England and Ireland, and Bryant & May, of Great Britain, as well as prominent capitalists in both England and Canada are interested in a plant for the formation of a new match company to be situated at Pembroke, Ontario.

It is stated in Washington on high authority that the Interstate Commerce Commission has decided to force large reductions in grain rates. The order is being prepared and its official announcement may come any day. The reductions are expected to have an important bearing on imports of grain from Canada, which will be facilitated by lower rates.

The Seneca Falls Manufacturing Co., makers of lathes, became acquainted recently, with a persistent, if not belated reader. This man sent in a request for a certain woodworking machine which the company had not been making for ten years, and mentioned the date of the advertisement in which he had seen the machine described. One never can tell when and where a message is going to strike.

Jones Brothers and Company, Toronto, show case and store fixture manufacturers, for the period ending October 1st, 1921, had on file 920 orders for complete store equipment as against 916 orders for the same period last year. This, notwithstanding the fact that 1920 was the largest year in the history of the store fixture business in general and Jones Brothers in particular. R. J. W. Barker, the manager, states also that they have received more direct inquiries for equipment in the last six weeks than in the previous six months.

H. A. Harrison, 220 King St. W., Toronto, has just completed negotiations for the exclusive Canadian agency of the Critchley expanding reamers, which are manufactured by Chadwick & Trefathen, Portsmouth, N. H., U. S. A.

A few of the principal shoe manufacturing companies are now in a position to accept orders for delivery in less than six weeks' time. The manufacturers prices are firm and may advance. Such is the statement of Mr. S. Roy Weaver, manager of the Shoe Manufacturers' Association of Canada.

C. P. Lyman, of the Lyman Tube and Supply Co., Montreal, was killed a few days ago near Albany, N. Y. It seems that the automobile in which Mr. Lyman was travelling went into a ditch thereby causing his death. Mr. McNaughton, a business associate who was with him at the time, was severely injured.

Mr. Woodburn of Woodburns, Ltd., Montreal, has returned from a business trip to the coast and reports improving conditions there, although very few orders are being actually obtained in certain lines, there is a large number of enquiries coming in all the time. Mr. Woodburn secured quite a number of orders, and arranged several contracts for electrical resistance and insulated wire.

Fort William, Ont.—Work on the addition to the Northwestern Elevator Co., plant has been started and it is expected that the building will be completed by the spring, and be ready for actual operation by the middle of next September. This addition will cost around $700,000 and will consist of 60 concrete tanks 22 feet in diameter and 95 feet in height. This will give the entire plant an aggregate capacity of more than 900,000 bushels. Cleaning machinery will be installed adapted to clean 8,000 bushels of grain per hour. Machinery valued at approximately $180,000 will be installed to make the addition a complete unit. About one-half of the total construction cost, or $350,000, will be expended on labor, and this will provide considerable employment in Fort William during the coming months.

That retailers of men's clothing evidently feel the country is going to roll up its sleeves, slip into overalls and become a deal busier some day than it is at present, is indicated by reports that overall manufacturers are busy. Mr. Surman, of the Peters Overall Co., Welland, also thinks it is a response to a very marked reduction in prices to the retail trade, say about 60 per cent, which reduction was largely made by lower prices on cotton materials. The manufacturer who covered requirements at these prices protected himself to a certain extent against present rising tendency. The retailers also evidently feel that, stocks being low, nothing very much better in the matter of prices may be expected—so that industry sees the excuse for idleness eliminated in that it can secure its overalls again at comparatively reasonable figures.

Toronto.—A new concern, The Tools & Stampings Ltd., has started at 87 Jarvis St. They will manufacture dies, tool, and metal stampings, and will also handle electro-plating work. Mr. Wise is the owner of the new concern.

A Buffalo house, doing business with the foundry trade, reports a growing feeling of confidence in buying supplies—due in some measure to much lower prices and also to the feeling that business seems due for a recovery. As manufacturers of a certain kind of oil, they point out that the general demand seems to be developing from gallon, to barrel capacity, and they expect to see it gradually work back to the carload lot class.

J. E. Dalrymose, vice-president of the G. T. R., says that business in Eastern Canada is improving. The grain movement, says Mr. Dalrymose, is an important factor in helping the railways at present. Between July 1 and September 30 more than 40 per cent. of all the grain exported was handled by the port of Montreal, the amount being equal to the grain exported from all other ports in Canada and the United States during the period named.

Preston, Ont.—Mr. Kerr of Preston Woodworking Machinery Co. reports that they are being kept busy on full time. They are now employing 45 of their regular staff of 70 men. He also states they sold a sand riddle to Scotland and he is in hopes it will be a fore-runner of extensive sales in the United Kingdom. They now have an order in hand to supply the city of Toronto with 250 electric light standards.

On October 16th, the flour mill of Lawrence and Wakefield, Dresden, Ont., was completely destroyed by fire, along with eleven thousand bushels of wheat and two hundred bags of flour. The mill, which was Dresden's largest industry, was running twenty-four hours a day, six days in the week and had abundant orders booked to keep operating to capacity for some weeks to come. The loss is estimated at $80,000 and is partially covered by insurance. It is the intention to rebuild as soon as possible.

The Butterfield Company, Rock Island, Que., and Derby Line, Vermont, have just completed their new Derby Line factory which is to entirely replace the old Derby Line plant in the manufacture of their goods. Derby Line Vt., is just across the street from Rock Island, Que., where the Canadian plant of the firm is established. The new plant in the latter place has been in operation for about a year. The management have announced that the Canadian plant will in future handle their entire export business, a fact that will mean a considerable increase in their Canadian business. It is also reported that they have plans out for an extension to the Canadian plant to double the present size for this export trade, same to be built whenever business conditions justify.

The recent increased activity in the textile industries of Canada during the past five weeks is continuing. Observers of textile operations incline to the view that activity will prevail until the end of the year at least, and that developments in the near future will largely determine the course of events in the first half of 1922.

Anglo-Canadian Wire Rope Co., of Montreal, reports a number of enquiries within the past month. They have also secured several orders from these enquiries. This concern is getting in a supply of wire which will carry them through this winter and enable them to fill orders. They are looking forward to steady improved conditions from now on.

One concern in Montreal reports several rush orders for belting. Upon enquiring it was found that this belting was wanted not for immediate use but to be on hand in case of a breakdown. This would seem to indicate business in the future, as heretofore firms have been in the habit of allowing equipment to run on regardless of its condition, rather than spend money for spare equipment.

The big dam at Kenogamis Lake, near the head of the Mattagami River, has been completed. This dam is calculated to back the water up about thirty miles, and raise the level about 10 feet. Officials of the Northern Canada Power Company say this is adequate provision for ample hydro-electric power throughout the winter, provided the fall does not turn exceptionally dry.

The Northeast Coast steel manufacturers in England, have made a drastic cut of 70 shillings per ton in the price of ship plates. This is equal to about $17.00. The makers claim the price now quoted does not only wipe out profits, but incurs great losses, which they felt they must make in order to encourage trade.

The $5,000 000 Hydro-electric power plant at Twin Falls, which is helping to drive the paper mills of the Abitibi Power & Paper Co. at Iroquois Falls is now entirely completed. The Twin Falls power plant is the largest ever installed in this part of Northern Ontario, the generating capacity being approximately 28 000 h. p. thereby more than doubling the former amount of electric energy generated by the Abitibi Co.

Mr. M. J. O'Donnell, formerly local representative of Herbert, Morris, Crane & Hoist Co., Niagara Falls, Ont., is now connected with Rudel-Belnap Machinery Co., Ltd., 137 McGill St., Montreal. The most of his time will be taken up looking after their outside interests in the Province of Quebec and Eastern Ontario. Mr. O'Donnell has been connected with the machinery business for a number of years. He is a member of the Engineering Institute of Canada, and has specialized on equipment for the economical handling of material in the industrial field.

The British Columbia agent-general of London, England, has secured for his province contracts for structural timbers for naval dock yards. The director of naval dock-tracks also gives assurance that preference will be accorded dominion products in the awarding of future contracts.

Ottawa, Ont.—Fire brick dealers of Toronto, Montreal and Ottawa have interviewed R. R. Farrow, Deputy Minister of Customs and Inland Revenue protesting against the ruling that all fire bricks sold in Canada must be stamped with the name of the country from which they came. It is claimed that the indentation harms the fire brick, and adds to the cost. Nothing definite was accomplished, but their claim will be given careful consideration.

Some activity in the large railway shops of Buffalo is reported—but this is said to apply to minor repairs. Thousands of cars are standing in the Buffalo yards, some requiring brakeshoes and other minor but very essential repairs. A statement, made by one in touch with the situation is to the effect that the railways are buying brakeshoes by the hundred, instead of by the hundred thousand as in prosperous times. But the fact that the shops are being opened is taken to indicate that absolute necessity for repairs has become urgent and that gradually larger forces will be given employment.

On the American side of the line, there is some tendency to deplore, if not to resent, the tendency on the part of autocratic buyers to name their prices in buying and to adopt an accept-or-behanged attitude. Of course, such a development may have received some encouragement during a period of fluctuating prices, when there appeared to be no stability and the mistaken idea got abroad that a price was the result of a random shot but always allowed for a good profit. Prices on many commodities are now at a low level, competition has become keen, standards of quality are again a big factor, and in protesting against unreasonable dictation, manufacturers who have goods of merit declare that they are "going to be hanged" rather than submit.

Manufacturers in Western New York do not appear to view the threatened railway strike with a great deal of alarm. While there appears to be some doubt that a strike will be called, it is also felt that such a struggle could not come at a better time, as there are many men out of work. Industry is certainly not urgent, and there is an abundance of material from which to develope a substitute force to man the railways. The struggle had to come and if there is a showdown, manufacturers are of the opinion that the railroad men are going into it without that doughty ally—favorable public opinion. The fact that many old employees would also lose their pensions is also a consideration which should be worthy of a second thought.

Sault Ste. Marie, Ont. If present plans go through, $200,000 will be spent in dredging and other harbor improvements at the "Soo" next year. With an expected increase in the number of the lake carriers and Canadian locks sufficient to bear a 50 per cent. increase in traffic, the widening and deepening is planned, although a start will not be made until next year.

PECULIAR ERROR

Last week we ran the following item:—The Brown Boggs Co., Ltd., Hamilton, report 9,000 sales during the past week. Mr. Lavery, the sales manager, informed this paper that they expect a steady increase in sales from now on.

Instead of 9,000, the word 'good' should have been substituted. Read the item over with the word **good** in place, then see what a difference one word can make. The copy given to the composing room showed the word "Good," quite plainly, but the printer decided to improve on the copy, with startling results.

One of the most hopeful signs anywhere is that which points to the growing scarcity of lines on retail shelves. This condition is becoming evident not only in Canada but in the United States. A large pump manufacturer in Western New York sent a traveller south recently and in ten days out he had sent in orders amounting to a carload a day on small pumps.

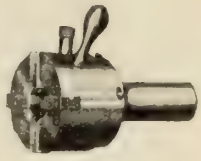
MARINE NEWS

Thirty-three per cent. of all the shipping which passed through the Panama Canal during the financial year 1921 was British, and 32 per cent. of all the cargo handled was carried in British bottoms, according to a report received in Washington from the canal zone. The percentage indicated this year has been maintained pretty constantly since 1918, though British vessels carried from 41 to 45 per cent of all traffic through the canal in 1915, 1916 and 1917. The relative decline is explained by the rapid development of American shipping during and after the war in Europe. For the financial year 1921 the most important British trade served by the Panama Canal was that between Europe and Australia and New Zealand, with an aggregate cargo tonnage for both directions of 950 000. Second place was taken by the trade between Europe and the west coast of South America with 747,000 cargo tons. Then followed the trade between the United States and Australia and New Zealand, with 506,000 tons; the trade between the United States and the Far East, with 451,000 tons; and, finally, the trade between Europe and the West Coast of North America. These five trade routes account for 81 per cent. of all the cargo carried through the Panama Canal under the British flag.

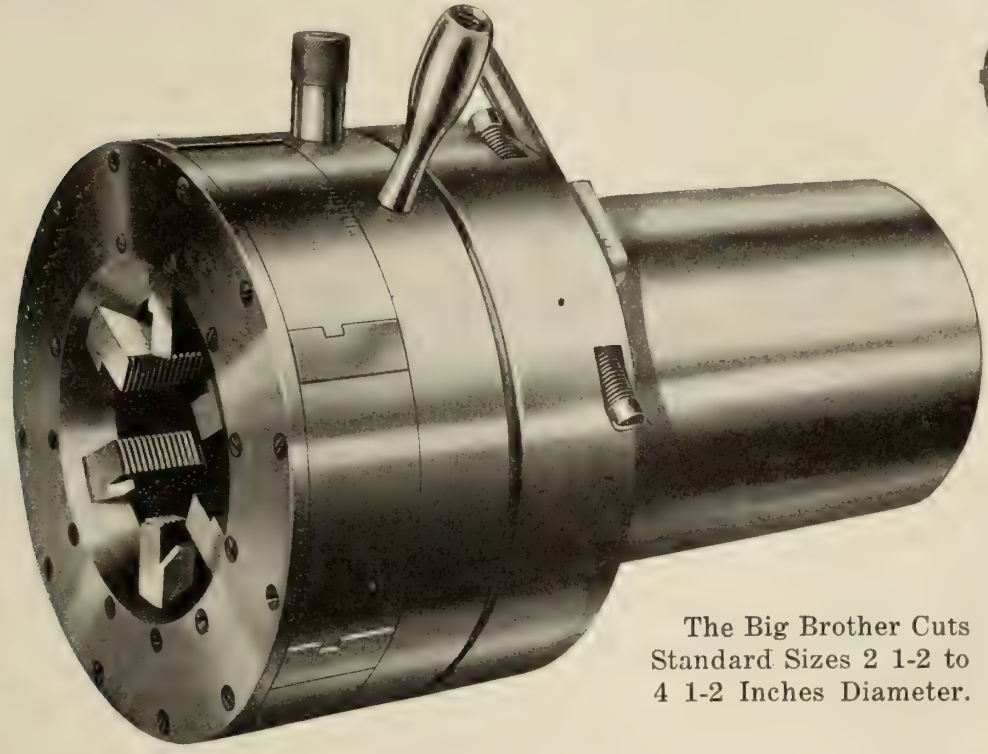
SOUTH AFRICA REPORTS INCREASE IN IMPORTS

Speaking on the imports of South Africa for 1920, trade commissioner W. J. Egan, in the weekly bulletin of the Department of Trade and Commerce, says that that year was phenomenal in automobile imports, this also applying to tires, which increased in value from $2,407,000 in 1919 to $6,105,000 in 1920. Canada's trade more than doubled in the two years fro $242,000 in 1919 to $574,000 last year. The United States figures of trade in tires are remarkable indeed, the jump from 1919 being from $716,000, to $2,523,750. The United Kingdon are very little different, jumping from $965,000 to $2,262,000. Imports from France also increased from $401,000 to $707,000, while imports from Italy dropped from $78,000 to $23,000.

In waterproof cloth and sheetings there was the same remarkable increase of imports, though not in the same proportion. Last year's imports were to a value of $312,390, an increase of $227,000 over the previous year. Canada's exports under this heading increased from $2,835 to $9,600, the United States from $12,000 to $57,000, and the United Kingdom from $70,000 to $242,975. In other manufactured rubber goods, including tire rubber, the total imports last year were to a value of $704,000, which is about three times the total average annual pre-war value import. Canada's trade under this heading, which has increased, due to representation, from $50 in 1914 to $22,740 last year, just about held its own with the 1919 figures, which were $210 more in that year. The United States increased from $144,000 to $188,000, and the United Kingdom from $222,000 to $474,000. France and Japan still retain their share of the trade, which is however, in very small figures.



DEMAND FOR MORE MACHINERY



Spain is becoming a more important market for machinery every year, and all but a very small proportion is imported, says the British Export Gazette. The Spanish farmer, for instance, is just beginning to realize that he is a back number in regard to methods and appliances, and is slowly replacing his wooden ploughs and hand threshers, are all that local industry has provided him with, by implements of more modern type, importing them from America, Canada, Great Britain and Germany. The same is true of plants for other industries, such as water turbines, machine tools, centrifugal and other pumps, carpenters' tools and small motors, these being among the lines most in request, and for which there is the prospect of a big demand.

LITTLE, BUT O MY!

IT'S A GEOMETRIC---

The Little Fellow Cuts Standard Screw Threads from 3-32 to 9-16 inch Diameters, and Cuts Them Just as TRUE as the Big Brother.

The Big Brother Cuts Standard Sizes 2 1-2 to 4 1-2 Inches Diameter.

Special Geometric Die Heads take Threaded Diameters up to the Greatest Requirement

It does not matter what the size is, every Geometric Self-Opening Die Head is the Big Brother on any Screw Machine Job.

UNITED STATES ANTI-DUMPING ACT DETAILS SHOULD INTEREST EXPORTERS

SPEAKING on the subject of the United States Anti-Dumping Act, 1921, the weekly bulletin of the department of trade and commerce say that several enquiries have been coming into them regarding this piece of legislation. In order that readers of Canadian Machinery may have this information at their finger tips, we publish the details below.

The following sections of the act, which includes the Emergency Tariff, should be of interest to all exporters. The effect of the Anti-Dumping Act is to levy, under certain conditions given below, a special duty equal to the difference between the "foreign home value" of goods and the actual "sales price." Unlike the new schedule of duties in the Emergency Tariff, which are to remain in force only six months from the date of enactment, the anti-dumping law is a permanent measure. We will take the sections in consecutive order:—

Sec. 201. (a) That whenever the Secretary of the Treasury (hereinafter in this Act called the "Secretary"), after such investigation as he deems necessary, finds that an industry in the United States is being or is likely to be injured, or is prevented from being established, by reason of the importation into the United States of a class or kind of foreign merchandise, and that merchandise of such class or kind is being sold or is likely to be sold in the United States or elsewhere at less than its fair value, then he shall make such finding public to the extent he deems necessary, together with a description of the class or kind of merchandise to which it applies in such detail as may be necessary for the guidance of the appraising officers.

(b) Whenever, in the case of any imported merchandise of a class or kind as to which the Secretary has not so made public a finding, the appraiser or person acting as appraiser has reason to believe or suspect, from the invoice or other papers or from information presented to him, that the purchase price is less, or that the exporter's sales price is less or likely to be less, than the foreign market value (or in the absence of such value, than the cost of production) he shall forthwith, under regulations prescribed by the Secretary, notify the Secretary of such fact and withhold his appraisement report to the collector as to such merchandise until the further order of the Secretary, or until the Secretary has made public a finding as provided in subdivision (a) in regard to such merchandise.

Special Dumping Duty

Sec. 202. (a) That in the case of all imported merchandise, whether dutiable or free of duty, of a class or kind as to which the Secretary has made public a finding as provided in section 201, and as to which the appraiser or person acting as apraiser has made no appraisement report to the collector before such finding has been so made public, if the purchase price or the exporter's sale price is less than the foreign market value (or, in the absence of such value, than the cost of production) there shall be levied, collected and paid, in addition to the duties imposed thereon by law, a special dumping duty in an amount equal to such difference.

(b) If it is established to the satisfaction of the appraising officers that the amount of such difference between the purchase price and the foreign market value is wholly or partly due to the fact that the wholesale quantities in which such or similar merchandise is sold or freely offered for sale to all purchasers for exportation to the United States in the ordinary course of trade, are greater than the wholesale quantities in which such or similar merchandise is sold or freely offered for sale to all purchasers in the principal markets of the country of exportation in the ordinary course of trade for home consumption (or, if not sold or offered for sale for home consumption, then for exportation to countries other than the United States), then due allowance shall be made therefor in determining the foreign market value for the purposes of this section.

Purchase Price.

Sec. 203. That for the purposes of this title, the purchase price of imported merchandise shall be the price at which such merchandise has been purchased or agreed to be purchased, prior to the time of exportation, by the person by whom or for whose account the merchandise is imported, plus, when not included in such price, the cost of all containers and coverings and all other costs, charges, and expenses incident to placing the merchandise in condition, packed ready for shipment to the United States, less the amount, if any, included in such price, attributable to any additional costs, charges, and expenses, and United States import duties, incident to bringing the merchandise from the place of shipment in the country of exportation to the place of delivery in the United States; and plus the amount, if not included in such price, of any export tax imposed by the country of exportation on the exportation of the merchandise to the United States; and plus the amount of any import duties imposed by the country of exportation which have been rebated, or which have not been collected, by reason of the exportation of the merchandise to the United States; and plus the amount of any taxes imposed in the country of exportation upon the manufacturer, producer, or seller, in respect to the manufacture, production or sale of the merchandise, which have been rebated, or which have not been collected, by reason of the exportation of the merchandise to the United States.

Exporter's Sales Price.

Section 204. That for the purpose of this title the exporter's sales price of imported merchandise shall be the price at which such merchandise is sold or agreed to be sold in the United States, before or after the time of importation, by or for the account of the exporter, plus, when not included in such price, the cost of all containers and coverings and all other costs, charges, and expenses incident to placing the merchandise in condition, packed ready for shipment to the United States, less (1) the amount, if any, included in such price, attributable to any additional costs, charges, and expenses, and United States import duties, incident to bringing the merchandise from the place of shipment to the country of exportation to the place of delivery in the United States, (2) the amount of the commissions, if any, for selling in the United States the particular merchandise under consideration, (3) an amount equal to the expenses, if any, generally incurred by or for the account of the exporter in the United States in selling identical or substantially identical merchandise, and (4) the amount of any export tax imposed by the country of exportation on the exportation of the merchandise to the United States; and plus the amount of any import duties imposed by the country of exportation which have been related, or which have not been collected, by reason of the exportation of the merchandise to the United States; and plus the amount of any taxes imposed in the country of exportation upon the manufacturer, producer, or seller in respect to the manufacture, production, or sale of the merchandise, which have been rebated, or which have not been collected, by reason of the exportation of the merchandise to the United States.

Foreign Market Value.

Sec. 205. That for the purpose of this title the foreign market value of imported merchandise shall be the price, at the time of exportation of such merchandise to the United States, at which such or similar merchandise is sold or freely offered for sale to all purchasers in the principal markets of the country from which exported, in the usual wholesale quantities and in the ordinary course of trade for home consumption (or, if not so sold or offered for sale for home consumptin, then for exportation to countries other than the United States),, plus, when not included in such price, the cost of all containers and coverings and all other costs, charges, and expenses incident to placing the merchandise in condition packed ready for shipment to the United States, except that in the case of merchandise purchased or agreed to be purchased by the person by whom or for whose account the merchandise is imported, prior to the time of exportation, the foreign market value shall be ascertained as of the date of such purchase or agreement to purchase. In the ascertainment of foreign market value for the purposes of this title, no pretended sale or offer for sale, and no sale or offer for sale intended to establish a fictitious market, shall be taken into account.

Cost of Production.

Sec. 206. That for the purposes of this title the cost of production of imported merchandise shall be the sum of—

(1) The cost of materials of, and of fabrication, manipulation, or other process employed in manufacturing or producing, identical or substantially identical merchandise, at a time preceding the date of shipment of the particular merchandise under consideration which would ordinarily permit the manufacture or production of the particular merchandise under consideration in the usual course of business;

(2) The usual general expenses (not less than 10 per centum of such cost) in the case of identical or substantially identical merchandise;

(3) The cost of all containers and coverings, and all other costs, charges, and expenses incident to placing the particular merchandise under consideration in condition, packed ready for shipment to the United States; and

(4) An addition for profit, (not less than 8 per centum of the sum of the amounts found under paragraphs (1) and (2) equal to the profit which is ordinarily added, in the case of merchandise of the same general character as the particular merchandise under consideration, by manufacturers or producers in the country of manufacture or production who are engaged in the same general trade as the manufacturer or producer of the particular merchandise under consideration.

U.S. FOREIGN TRADE SHOWS A DECLINE

A review of the statistics of the foreign trade of the United States for the first six months of 1921 brings out the fact that the values of exports and imports have declined appreciably as compared with the high values of the first half of 1920. This was to be expected in the light of the sharp fall in prices of most commodities, together with a world-wide trade depression.

Month by month, beginning with January, 1921, the value of exports fell steadily, with one exception: the total for June was 7 million dollors higher than that for May. As compared with the values of a year ago export trade was off about 40 per cent. Although the break in the values of imports came early in the fall of 1920, a slight reaction occurred in February, March, and April, 1921, the imports increasing from 209 million dollars in January to 254 millions in April, only to drop during May and June. The value of the imports for the entire six months was less than half that for the January-June period of 1920. The balance of trade for the first half of this year was not far different from that of the first half of 1920, there being still a huge excess of exports, amounting to nearly one and a quarter millions in April.

CATALOGUES AND PAMPHLETS

The Northern Crane Works, Limited of Walkerville, Ont., have issued a very interesting bulletin, which describes their type "E" electric travelling crane. This bulletin No. 504-C is well illustrated, showing the various parts of the crane and its operation under varying conditions.

The Oakley Chemical Co., New York has issued a booklet entitled "Modern Cutting and Grinding." Some valuable information is contained therein and of course they tell how their particular product can be used to advantage. There are some interesting tables for the mechanic in the latter portion of the book.

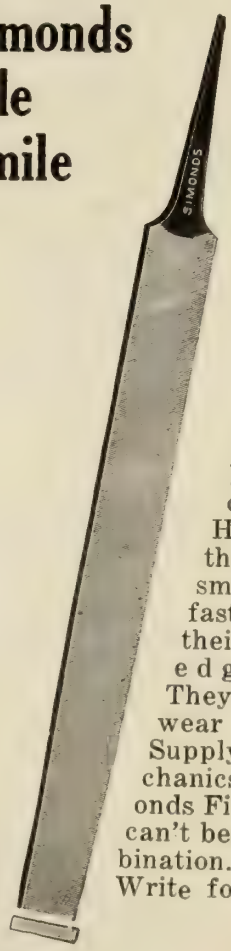
RAILWAY CONDITIONS

Speaking on the subject of railway conditions in Russia, Railway and Locomotive Engineering says that out of a total of 19,106 locomotives in a good condition before the war, there are at present from 5,500 to 7,650 reported in working order by different authorities, or a decrease of motive power by 60 to 75 per cent. Of that number approximately 1,000 are idle owing to lack of fuel. Serviceable cars are reported at from 150,000 to 286,000, or a decrease of from 48 to 70 per cent of the pre-war number.

The roadbeds are reported in very bad condition, and if large repairs are not made in the next few months considerable sections will have to be closed to traffic. According to the latest estimate at least 25,000,000 ties must be replaced and the present program calls for only 5,000,000 replacements. A considerable mileage of branch lines has been removed and used for repair material.

The fuel situation is very serious. Cessation in production of coal by 80 per cent and the deterioration of the mines has forced the railways to depend much more upon wood. Such wood must come from the forests of northern Russia, and the haul is too long for supply to southern Russian railways. An effort has been made to change the locomotives on the southern railways into oil burners, but the gradual decline of oil production has limited this transformation.



In the course of construction there were 88 auxiliary railroad lines for the forest work, including 38 of narrow gauge and 50 of broad gauge. There were at the beginning of the year in course of construction 626 miles of railroads, 250 miles narrow gauge, and broad gauge 366 miles. About 70 per cent of the roadbed was completed and rails were laid to a length of 142 miles. The construction of these auxiliary railroads are handicapped by the shortage of workmen, as they were constantly leaving, and the work often temporarily abandoned.

ANNEALING STEEL

To anneal high-speed steel thoroughly, the Consolidated Steel Corporation's instructions state it should be packed with granulated charcoal in an iron box or pipe sealed with about half an inch of charcoal between the steel to be annealed and the walls of the pipe or box. The whole should be heated slowly and uniformly, until heat has penetrated to the centre to a temperature of about 1500° to 1550° F. (a light cherry red), and held there for several hours, allowing it to cool off slowly, preferably with the furnace, or, if desired, the box or pipe may be removed from the furnace and buried in dry ashes or slaked lime. Under no circumstances, however, must the steel during the annealing process come into contact with the air.

The Simonds File Smile

A good mechanic is pleased when he has Simonds Files. He knows that they cut smooth and fast and hold their cutting edge longer. They will outwear other files. Supply your mechanics with Simonds Files and you can't beat the combination.

Classified Opportunities

MACHINERY WANTED

WANTED 4 old lathes and a planer; will be used for special machines so condition does not matter. Price must be low. Box 792 Canadian Machinery. (c16m)

MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W. H Sumbling Machinery Co., Toronto. (etfm)

POSITIONS WANTED

OPEN FOR ENGAGEMENT AS GENERAL Manager, Factory Manager or General Superintendent. Have had a good engineering education and 17 years' experience in executive positions in mechanical lines on interchangeable manufacture of typecasting machines, firearms, electrical work, experience on drop forging, heat-treating and testing of steel tool design and making. Box 793. Canadian Machinery. (c16m)

MECHANICAL ENGINEER, COLLEGE GRAduate with seven years' experience as Mechanical executive and in the design, operation and largest of Power Plants and Factories, accustomed to responsibility, desires position, best of references Box 791, Canadian Machinery. (c16m)

MECHANICAL ENGINEER — (GRADUATE School of Technology, Gloucester, Eng.)—12 years' experience, design and production of high-class automobile and aircraft engines with leading British manufacturers. During the war attached to Air Department, British Admiralty, as supervisor of the construction of aircraft engines, including Rolls-Royce, is open for engagement. Just completed installation of industrial plant in Canada. Box No. 794, Canadian Machinery.

SALESMAN WANTED

ADVERTISER WOULD LIKE TO HEAR FROM a man who first of all is a real salesman; who has vision and a capacity for putting across big things. He should possess a knowledge of the Canadian trade, and of machine tools, and up-to-date engineering practice. State age, experience, and sufficient information to enable us to determine whether you are the man we want. The salary we are prepared to pay is big enough to attract a big man. If desired, information regarding identity of advertiser may be secured from Canadian Machinery before sending application. Apply Box 794N, Canadian Machinery.

Machinery Wanted

Advertisements under this heading will be inserted once free of charge. Readers are invited to use this department when in need of equipment. Replies may be sent to box number, care of Canadian Machinery, if desired.

Grey Iron Castings

Light and Medium-Bench and Floor Repetition Castings; Capacity 15 tons per day.
Expert Metal and Wood Pattern Work. Our advice and estimates will save you money.
Semi-finishing operations on Lathe or Grill on Castings supplied if required.

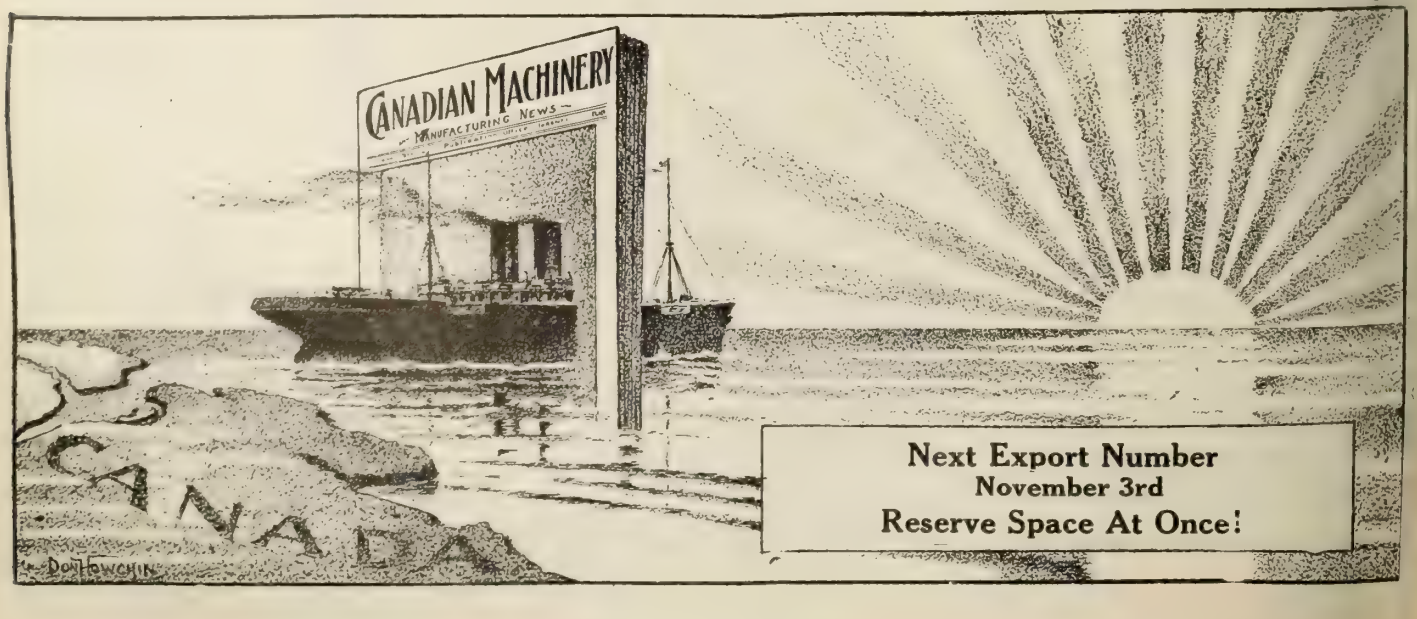
PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (etfm)

BRANTFORD PATTERN WORKS ARE PREpared to make up patterns of any kind—including marine works—to sketches, blue prints or sample castings. Prompt, efficient service. Bell 'Phone 631; Machine 'Phone 733. Brantford Pattern Works, 49 George St., Brantford, Ont. (etfm)

BUSINESS CHANCES

WANTED—BY AN ESTABLISHED CONCERN. Twelve to fifteen thousand dollars for a period of from one to three years, to take care of business expansion. This concern will stand the fullest investigation. 8% is offered with ample security to principals only, with an opportunity of becoming permanent associates with the partners, if mutually satisfied. Box 767, Canadian Machinery. (etfm)



FOR SALE

FOR SALE — COMPLETE PATTERN EQUIPment for the manufacture of a line of goods sold to Wholesale Hardware and Machinery Jobbing Houses. Good future before it and very little Canadian competition. Investment of about $2000 00 only, required. Must be sold quickly. Very suitable as additional line to Foundry and Machine Shop business. Apply Box No. 790, Canadian Machinery. (c16m.)

LARGE QUANTITY OF VALVES—ALL SIZES, surplus stock of a Canadian shipbuilding company. Write for list, prices, etc. Box 789 N, Canadian Machinery.

ACETYLENE GAS CYLINDERS FOR TRANSFER 18 Type W. K. Acetylene Gas Cylinders for Disposal. If you are contemplating leasing one or more get in touch with us at once. Present factory price of lease for these cylinders, $80.00; Our price of lease for these cylinders, $60.00. Apply Box 787 Canadian Machinery. (c17m)

FOR SALE — ONE "NEW BRITAIN" SIXspindle automatic screw machine, 1-5/8" capacity, new. Located in Ontario, duty paid. Low price for quick sale. New Britain Machine Co., New Britain, U. S. A. (c19m)

Surplus Machinery

Tool Room, Manufacturing Machines and Miscellaneous Equipment, for sale

Lathes.

2—12″ x 4′ Mulliner Tool Room, Taper.
1—14″ x 6′ Reed, Q. C. G., Taper and Relieving, oil pan, and collets.
1—14″ x 6′ Lodge & Shipley, Q.C.G., Taper, collets and oil pan.
1—16″ x 6′ Cisco, Q.C.G., Taper.
1—16″ x 6′ Hendey, Taper, collets and oil pan.
1—16″ x 6′ Hendey, Taper.
1—16″ x 6′ Pratt & Whitney, Taper, and collets.
1—16″ x 8′ Hendey, Taper.
1—16″ x 8′ American, Q.C.G.
1—16″ x 8′ Prentice, Taper, collets and oil pan.
1—16″ x 8′ Pratt & Whitney, Q.C.G., and taper.
1—18″ x 8′ American, Q.C.G., and Taper.
1—18″ x 8′ Hamilton, D.B.G., Q.C.G.
1—18″ x 8′ Walcott, D.B.G., Q.C.G.
1—21″ x 8′ Le Blonde, Heavy Duty, D.B.G. Q. C. G.
2—24″ x 10′ Lodge & Shipley, D.B.G., 2 C.G.
1—24″ x 10′ Can. Mchy. Corp. D. B. G. QCG
1—24″ x 12′ Can. Mchy. Corp., D. B. G. Q.C.G.
1—26″ x 10′ Lodge & Shipley, D. B. G., Q.C.G.
2—26 x 12′ Can. Mchy. Corp., D. B. G., Q. C. G.
1—26″ x 14′ Nile Bemont Pond, D. B. G., Q. C. G.
1—30″ x 14′ Niles Bemont Pond, D. B. G., 2. C. G.

Hand Screw Machines

30—No. 1 1/2 Star G.F.H., 1 1-2″ Cap., Power Feed Turret, oil pan and pump.
6—No. 3 Superior, Plain Head, 1 1-4″ Cap., oil pan and pump.
1—No. 4 Warner & Swasey, G.F.H., 1 1-2″ cap., Power Feed Turret oil pan and pump.
6—No. 4 Smurr & Kamer, G.F.H., 1 5-8″ cap., Power Feed Turret, oil pan and pump.
2—No. 4 Millholland, G.F.H., 1 1-2″ cap., Power Feed Turret, oil pan and pump.
11—No. 2 Smurr & Kamer, Plain Head, 1 1-16″ cap., oil pan and pump.
8—No. 2—Warner & Swasey, Plain Head, 1″ cap., oil pan and pump.
4—1 3-4″ x 7″ Gridley Multiple Spindle Automatics.
7—2 1/4 x 7″ Gridley Multiple Spindle Automatics.
8—3 1-4″ Gridley Single Spindle Automatics.
7—No. 55 Acme Automatic, Multiple Spindle.
12—No. 56 Acme Automatics, Multiple Spindle.

Shapers.

2—20″ Smith & Mills, B. G., Crank Shapers.
1—20″ Gould & Eberhardt Crank Shapers.

Milling Machines.

1—No. 3 Ford Smith Universal.
1—No. 2 Kempsmith Universal.
2—No. 3 Cincinnati Plain.
1—No. 2 Ford Smith Plain.
9—No. 1 Burke Bench Millers.

Drilling Machines.

2—Alfred Herbert 7″ overhang, ball bearing.
3—No. 1-2 Avey, Pedestal.
2—No. 1-2 Avey, Bench.
1—Leland Gifford, 6″ overhang, ball bearing, pedestal type.
1—Sipp, ball bearing, pedestal type, swing 16″.
4—Leland Gifford, 6″ overhang, ball bearing, bench type.
6—1-4 Rickert & Shafer, vertical tappers on pedestal.
1—5/8″ Rickert & Shafer, horizontal tappers on pedestal.
1—No. 1 1-2 Cincinnati.

Tool & Cutter Grinders.

1—No. 1 Norton.
1—Greenfield.
6—Stevens.
1—No. 2 Brown & Sharpe Surface Grinder.

Miscellaneous.

1—14 x 9 x 12 Can. Ingersoll Rand Belt Driven Air Compressor with receiver.
2—75 H.P. Crocker-Wheeler Motors, 25 cycle, 3 phase, 550 volt, 750 R.P.M.
1—75 H.P. Can. Westinghouse, 25 cycle, 3 phase, 550 volt, 750 R.P.M.
3—Gas Furnaces.
2—High Speed Hack Saws.
1—No. 2 Standard Double Acting Press.
1—2,500 Ampere Plating Dynamo.
1—No. 9 Buffalo Conoidal Fan.
1—No. 5 Sheldon Exhauster, Motor Drive.
1—No. 2 Garvin Screw Slotter.
1—No. 1 Garvin Screw Slotter.
1—No. 2 American Oil Separator.
1—14 x 24 C.H.V.W. Mechanical Plater.
6—No. 2 Garvin Screw Shaving Machines.
8—B. & S. Polishing and Finishing Machines.
Pulley, Shafting, Couplings, Hangers and miscellaneous small tools.

The above equipment open for inspection at our plant, corner of DUFFERIN and KING STREETS, TORONTO

Do You Read These Advertisements?

Every advertisement in this magazine is worth reading. It is the product of some concern that is using a modern method of making sales, viz., technical paper advertising, in order to present most effectively to you the leading features of its line.

These advertisers are making it easier for you to buy intelligently with the least waste of your time and theirs. They realize that a sales force can not replace this service at equal cost. They know that advertising is good business, for the manufacturer who does not advertise cannot save the cost of advertising. Consistent advertisers are progressive merchandisers. They are saving your money and their own; and it pays to do business with them.

Don't miss your opportunities. These advertisements are interesting. Many are distinctly instructive, and a glance through them every month will keep you posted on the latest developments for power house equipment.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Over eight pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

BUTTERFIELD

—the tools you buy again

The Necessity of Good Tools

AN OBSERVANT manufacturer is quoted as saying: "A good many of us spend a lot of money in equipping our plants with the best of machinery—then pay little attention to the tools that insure its profitable operations. A first class milling machine must have first class cutters to give maximum results; the same applies to drilling and all other operations of a like nature. The selection of tools is of vital importance."

This advice is worth heeding. Investigate the production of your machines and if they are not up to the standard give Butterfield Tools a trial—they have a record of over 35 years of success.

SMALL TOOLS

Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.

Miscellaneous Franklin Die-Castings

Amusing and Instructing the Public

FROM the mutoscope fifteen years back to the modern moving-picture machine marks a quick step in progress seldom equalled.

Manufacturers in this industry give due credit to the economy and efficiency of modern production processes such as die-casting. Franklin Die-Castings were used extensively by makers of mutoscopes. Today, they are used even more extensively by moving-picture machine manufacturers.

In 1892 we originated the Die-Casting Process. For nearly thirty years we have been reducing the cost and simplifying the output in many fields of industry. The addition of a special process for the production of finished brass castings now enables us to offer parts in brass, bronze, aluminum, tin, lead and zinc base alloys as conditions require, thus meeting a still wider range of work.

We quote from samples or blueprints. Write for booklet, "Franklin Die-Castings in Many Fields."

FRANKLIN DIE-CASTING CORPORATION

Gifford and Magnolia Streets - Syracuse, N.Y.

FRANKLIN DIE-CASTINGS

Diamond Fibre

the Universal Raw Material

It's STRENGTH

One instance where Hard Fibre has proved its superiority because of its strength and wearing qualities is in the making of noiseless gears—gears that are water, oil and grease proof—vulcanized fibre gears that will give service in places and under conditions where the average silent gear could not survive.

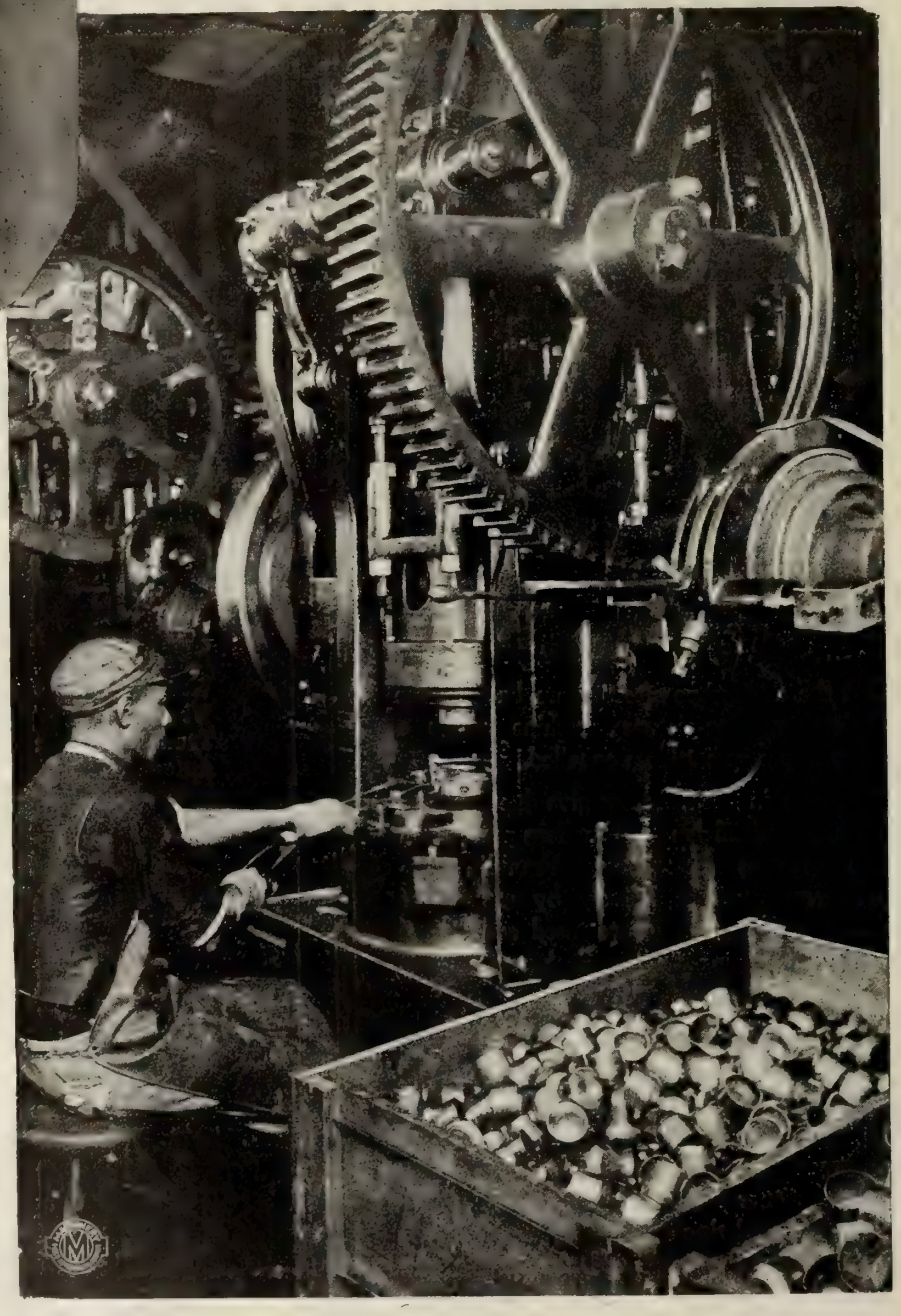
Head Office & Works:
235 Carlaw Ave. Toronto, Canada



Diamond Fibre is supplied in sheets, rods and tubes convenient for all manufacturing purposes or machined to specification if desired.

"BLISS" PRESSES—

for Fifteen Years Here

The service of this No. 1½ "BLISS" Double Action Toggle Press has sold three other "BLISS" Presses to the Frost Manufacturing Company, Kenosha, Wis., and all four are in constant use. When photographed this machine was blanking and drawing Tee ball connections for plumbing fixtures — parts cut from strips of .025 in. special annealed drawing brass stock 4 17/32 in. wide. The blank is 4⅜ in. diameter and the shell, which is shown in the close-up, is 2 5/16 in. diameter and 2 in. deep.

These Parts Are Cut and Drawn at One Stroke

The blank holder cuts the blank and the punch drives it through the drawing die. Output is 14,000 per ten-hour day. Subsequent drawing operations performed on these shells produce the perfect ball.

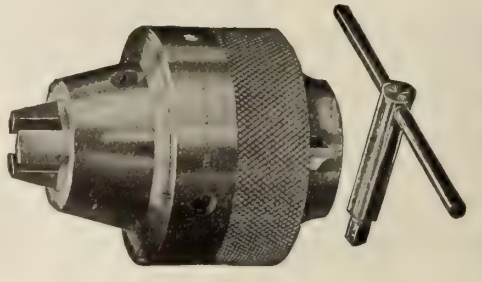
SKINNER DRILL CHUCKS
GIVE BETTER SERVICE



Trade Mark

Skinner Drill Chucks eliminate most of the trouble of accurate drilling operations, only because they are built right to hold the drill or tap accurately and run true or center. The hardened jaws are ground true.

They are easy to handle too, as there are no exposed gears to pinch the fingers.

The long life of Skinner Drill Chucks is due to the great care with which they are built. Made of the best materials available for the purpose. All working parts hardened to resist wear, and of sufficient strength to rigidly hold the tool to the work.

These Drill Chucks are all described in our catalogue, which will be sent to you with prices upon request.

THE SKINNER CHUCK COMPANY

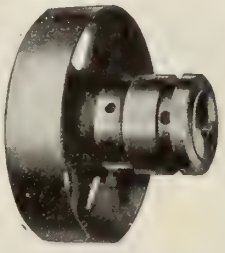
THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

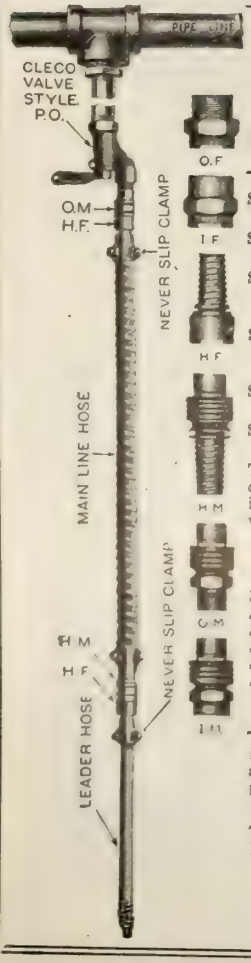
COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.



You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building" and our Yellow Catalog.

Cleco Pressure-Seated Air Valves

Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps — Cleco Grooved Hose Nipples and Hose Clamp Tool

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼ inch to 1½-inch.

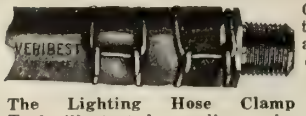
STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.



CLECO AIR VALVES.

Style R.A. **Style P.O.** **Style A.**

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style R.A.—Right Angle Valve, made in sizes ¼ in., ⅜ in., ½ in., and ¾ in.

CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

The Lighting Hose Clamp Tool illustrated applies wire clamps at a cost of 1* cents each.

In stock: Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

Use Annealed Wire No. 14

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.

Bulletins Nos. 46, 48 and 51. mailed on request.

THE MODEL HOSE LINE illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

FORD-SMITH

Grinders

ONE of the many good reasons is that FORD-SMITH Grinding machines can be operated by anyone of average intelligence. This of course means a big saving in wages as compared to machines requiring highly skilled operators. FORD-SMITH Grinders are equipped with work holders and other convenient features that enable the operator to make all his time count. The moderate cost and low upkeep are other features that make Ford-Smith Grinders a worth while investment.

Ford-Smith Grinders are made in essential sizes for every class of work. Before leaving the factory they are thoroughly tested and we can guarantee them satisfactory.

As long established manufacturers of grinders, many problems have come under our notice. If you desire advice it will be freely given.

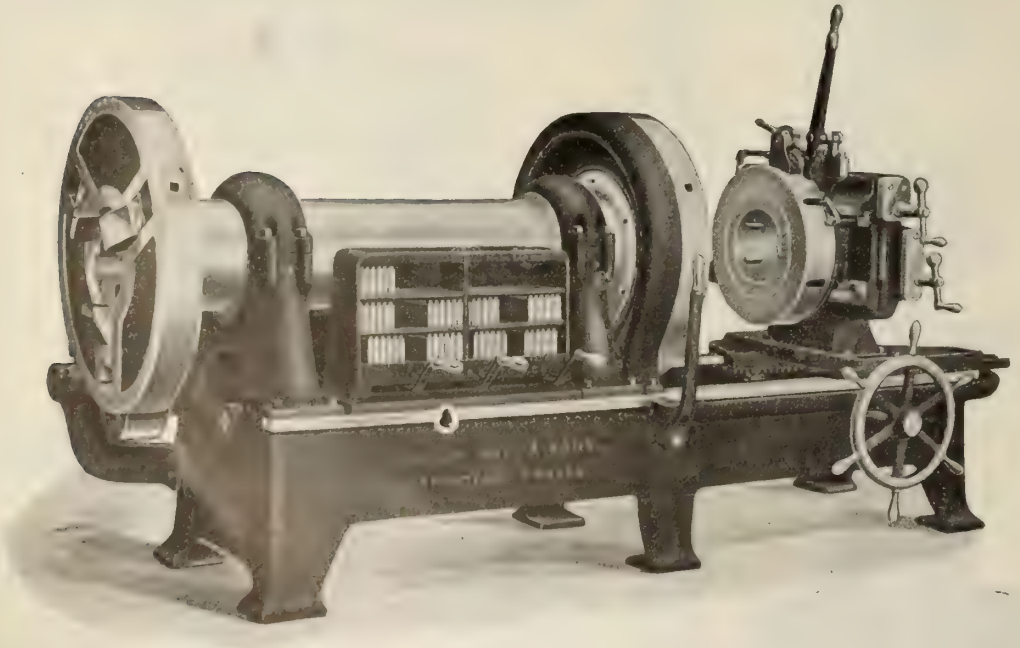
When Canadian Hall joined with U.S. Williams

A great day for pipe machine users.

IN CANADA when you think of pipe machines, the name Hall immediately comes to mind. In the United States it's the Williams machine that has won the reputation to thread pipe better, quicker and at lower cost. Now the advantages of both are combined in each. They have joined forces and the Hall is now the Williams of Canada.



Whether it's 1-8 inch or 16 inch pipe or any of the sizes in between, there's a Williams machine just right for the job. Built in eight sizes and each size especially designed to meet the requirements of the case. And remember, each Williams machine is backed by the combined features, experience and service of Hall of Canada and Williams of the United States, each a firmly established leader in its field.

You who do or should use power pipe machines will do well to write for the details of how and why this merger means greater economy, production and efficiency in pipe threading practice.

Ask for the new Williams' handbook "Don't Let It Happen To You."

Williams Tool Corp. of Canada, Ltd.

U. S. Plant: Erie, Pa.

The illustration is of our No. 8 new improved Duplex Type Standard, capacity 2½" to 8" inclusive.

WILLIAMS PIPE MACHINES

Cutting Commercially Accurate Threads in Monel with GTD *"Gun"* Taps and *"Acorn"* Dies

NO ordinary tap or die can thread Monel metal—a fact which up to now has limited its use in many plants, where its great strength and non-corrosive properties would otherwise strongly recommend it.

The GTD staff, however, recently made a series of tests with Monel and to the great satisfaction of the officials of The International Nickel Company, who produce this popular metal, proved that it can be tapped and threaded to any degree of commercial accuracy required in spite of its toughness and ductility.

Instead of
—cutting over size —clogging
—breaking —dulling
the GTD *"Gun"* Taps did their work as cleanly and with as little difficulty as they would in steel, and when thread after thread had been cut with the chips shooting ahead, in true "Gun" Tap style, the threads were gaged—the first and last in each hole measuring to size without perceptible variation.

With samples of threaded Monel and a report of the tests before them, the International Nickel Company sent in this letter, which we are proud to quote:

> "We have received and examined samples of Monel Metal threaded and tapped with your *"Acorn"* Die and *"Gun"* Tap. The fact that there are no indications of torn surfaces or of split threads is evidence of the efficiency of your tools.
>
> "You are to be congratulated that so successful a piece of work could be done using your stock tools, and by operators unfamiliar with threading Monel Metal."

If you have a threading problem which involves Monel or any other metal, which has previously been difficult to thread, try the *"Gun"* Tap and *"Acorn"* Die—specially designed exclusive GTD products. Or if you wish the experimenting done for you, write us stating kind of metal used, or sending sample—and our engineering department will demonstrate quickly and thoroughly how the *"Gun"* Tap and *"Acorn"* Die work. We will be pleased to send you circulars descriptive of the *"Gun"* Tap and *"Acorn"* Die. Just fill out and mail the attached coupon.

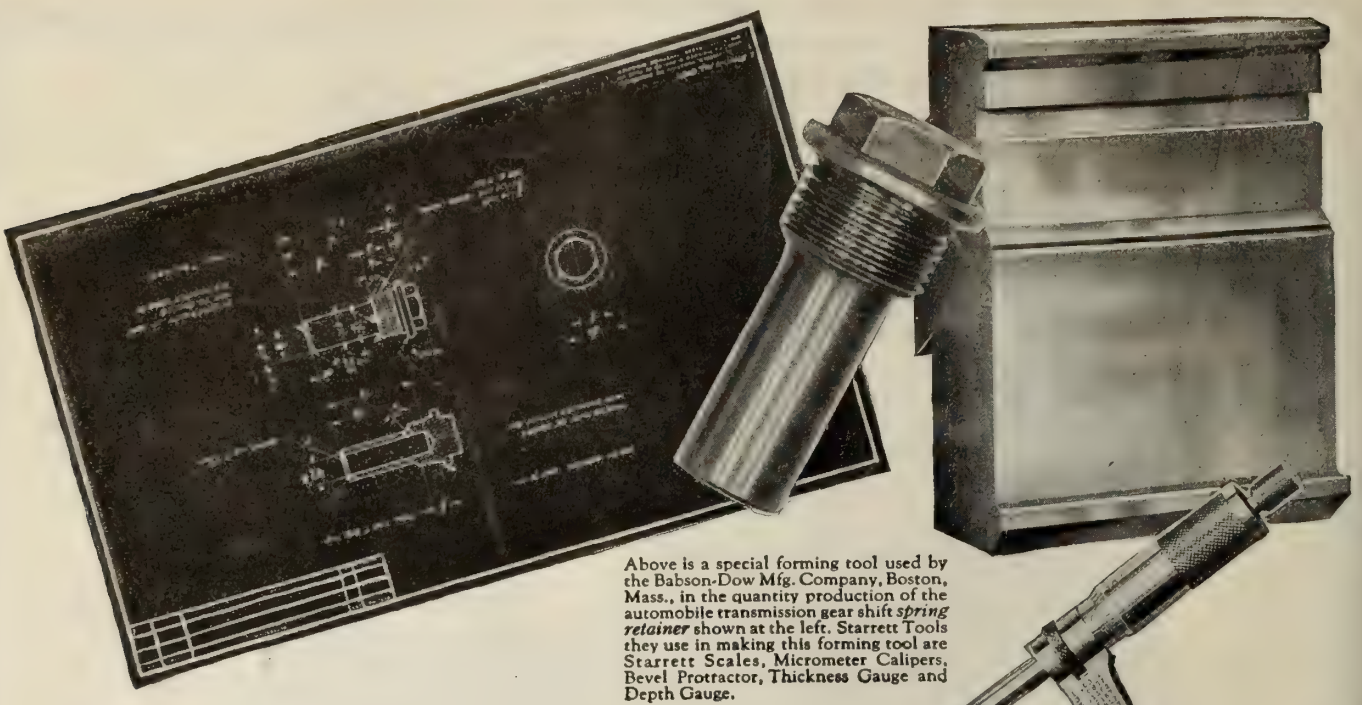
CANADIAN HART WHEELS

Vitrified — Silicate — Shellac

Canadian Hart Vitrified Wheels—recommended for the majority of grinding jobs. May be used wet or dry; give better all-around satisfaction and have a longer life.

Canadian Hart Silicate Wheels—can be made in twenty-four hours and are often substituted when it is inconvenient to wait the required length of time for Vitrified Wheels.



Canadian Hart Shellac or Elastic Wheels—indispensable for slotting work where a thin wheel is required, or for work requiring a special finish. Can be operated wet or dry.

Tell us what you want to grind and we will tell you the wheel to use for the best results.

THE NEW LANDIS AUTOMATIC DIE HEAD THREADING INTERMEDIATE GEAR STUDS

The New Landis Automatic Die Head has set up a new record in the Plant of an Eastern Manufacturer. It is shown threading intermediate gear studs, 1 inch diameter, 8 threads per inch, U. S. Standard form, length of thread 1 1-4 inches, actual threading time **20 seconds.**

This head embodies in its design many features which made the Landis Rotary Head a success. Furthermore, it employs the Landis long life chaser, which insures efficient and economical threading.

The foreman of the department in which this head is used is all smiles when talking about it. He says, "It is simple to operate, cuts accurate threads and with it I have set us a new time record for threading these studs."

Investigate this head. Send your specifications and we will gladly tell you just what the installation will mean for you.—Write today.

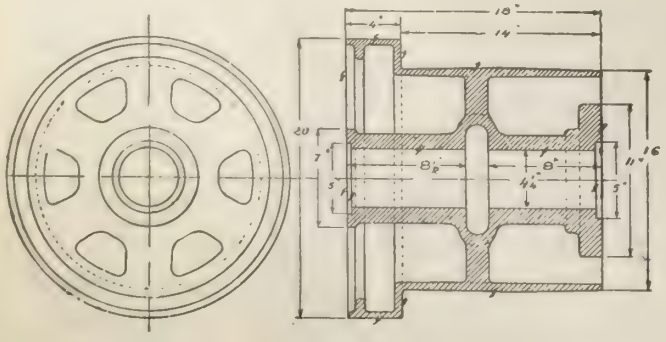
Finishing a 16 Inch Pulley in 60 MINUTES



Speaks Well For "STEINLE" Design and Construction

It is a demonstration of the ability of the Steinle Heavy Duty High Power Turret Lathe to pull maximum cuts at as high cutting speeds as the best tool steel will stand.

Especially is this made apparent when it is realized that the surface machined on each pulley is 1,446 square inches, the surfaces machined including turning the 16-in diameter, turning and facing the 20-in. diameter flange, boring the hub, and counterboring and facing one end of hub. All surfaces received a roughing and finishing cut.

Steinle lathes are built and equipped to handle with equal facility large or small castings or forgings or bar work up to 6¾ in.

Why not send us your blueprints so that we may show what "Steinle Saving" means as applied to your work?

Grinding the 500th Hole for the Month

This could just as well have happened in your shop if—

instead of cursing your luck, or hard times, you had just taken count of stock to see if your equipment would not fit in where you could get some of that 65 per cent. business that the rating houses tell us is being done this year.

We know where part of this comes from, that is—cylinder regrinding. Further, that only a very small percentage of the possibilities in this line can be handled by the equipment and shops now in the field.

It is not a charity proposition just to keep your men working, but there will be real mazuma left in the cash drawer each month instead of cobwebs.

Heald will handle all styles and sizes of cylinders.

Having already sold the Vulcan Brazing & Machine Company, Philadelphia, where the above photograph was taken, three Heald Machines, we do not expect compliments will land another for us, but here's a live wire crew that took Old Man Time by the forelock and are now leading him around gathering in the profit on a 500-hole monthly average from each machine.

What do I need to do this work, you may ask.

What have you got?

If it is a machine shop, auto repair shop or welding outfit you are collecting rust on, you have practically all the equipment needed except a Heald Cylinder Grinder and a stock of pistons and rings.

We will be glad to give you full information about the first, and tell you where you can get the second.

In fact we have a booklet we would like to mail you that tells you all about the possibilities, profits and equipment required.

What are YOU going to do about it?

The Canadian Fairbanks-Morse Company, Limited
Sales Agents

Note this note

—another example of Hoefer complete drilling service.

One man is rough-boring, size boring, and reaming at least 12 transmission cases an hour with this Hoefer Double-end Boring equipment at the Kenosha, Wis. plant of The Nash Motors Company. The sizes of holes and limits are shown on the print and the alignment of the two large holes drilled in the two opposite walls of the transmission case proves better than .003 in. on test bars running through both walls and extending 10 inches beyond the case. Hoefer equipment can do equally speedy and accurate work on **your** drilling jobs.

It isn't an easy matter to bore a transmission case quickly and truly. And this job had to meet mighty severe accuracy tests, for the Nash Motors Company are justifiably proud of their cars and insist on high quality work at each step of their production.

Hoefer was able to design and build not only boring equipment that met every requirement of speed and accuracy at reasonable cost, but also to furnish every tool, jig and fixture necessary to do the job, making complete guarantees of quality and quantity that were actually exceeded in practice.

The results obtained with Hoefer drillers justify an investigation of what they can do in **your** shop. And the completeness of Hoefer Driller Service with its blanket guarantee relieves you of all annoyances, delays and divided responsibility in connection with auxiliary equipment.

A complete Drilling Service that designs, furnishes and guarantees every tool, jig and fixture, and then guarantees quality and quantity of work done.

BROWN & SHARPE MACHINISTS TOOLS

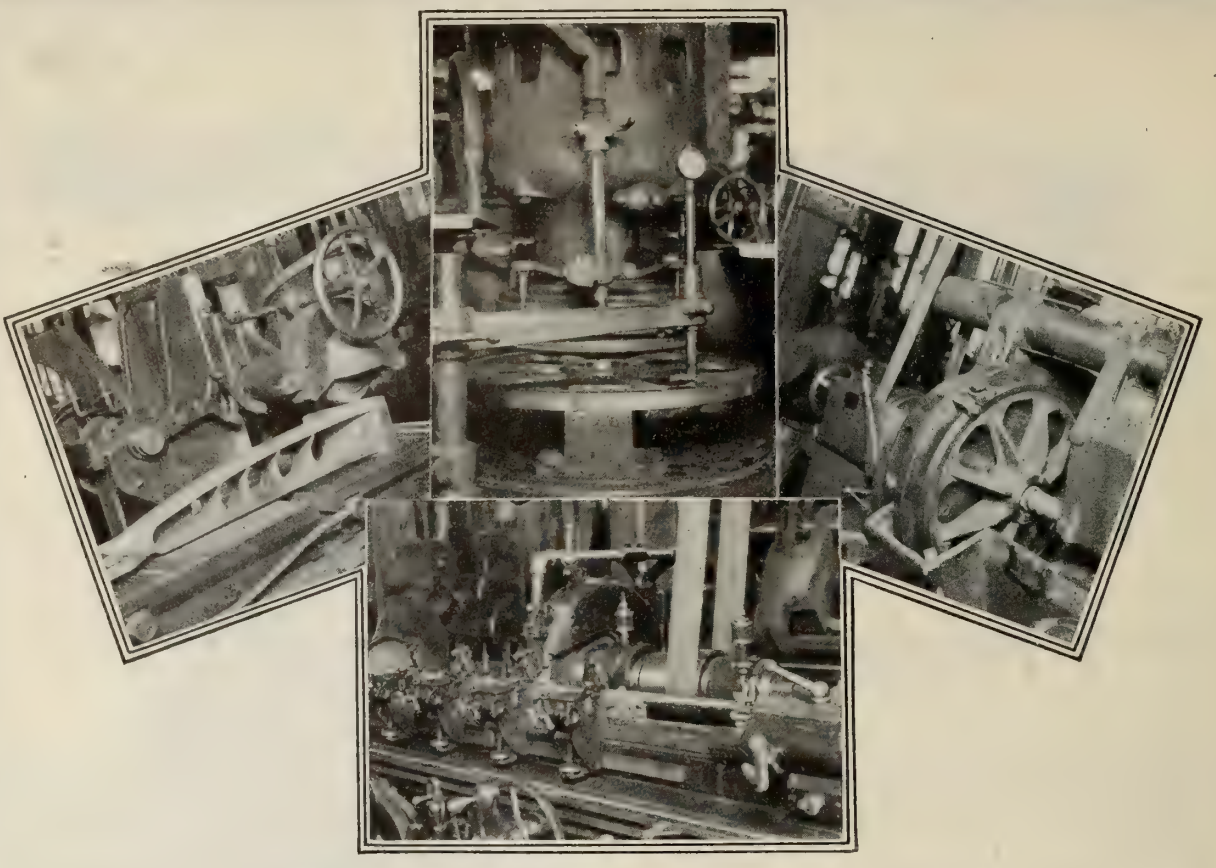
Precision

A clean, accurate punch mark just where you want it and of the proper depth is a great aid to better work and is the pride of every good workman.

By Using a

BROWN & SHARPE

Automatic Centre Punch



you can lay out work with a series of small marks of uniform size—or by adjusting the knurled screw on the top of the handle—you can get a deep, well centred mark for centring drills.

You have been looking for an Automatic Centre Punch with these advantages. Now's a good time to get one.

Send for our Small Tool Catalog 28 and inquire about this Automatic Centre Punch No. 771

Brown & Sharpe Mfg. Co.

Providence, R.I., U.S.A.

NORTON GRINDING WHEELS FOR PRECISION WORK

WHEREVER large production is being obtained along with extreme accuracy, Norton Alundum and Crystolon wheels will be seen on a variety of grinding operations.

The four pictures shown illustrate four classes of grinding on which Norton wheels are producing the desired results in a large plant manufacturing Gear Shapers.

Surfacing of the upper face of the lower index wheel of a shaper is done on a Blanchard surface grinding machine with a Crystolon wheel grain 20, grade H. The material is cast iron and 0.010 in. to 0.015 in. is removed from the rim and hub on each side. This operation is shown above in the top illustration.

A surfacing job is also shown on the Diamond machine. The part is the apron lever of a gear shaper. The 3824-K Alundum vitrified wheel enables a high rate of production with a close limit. This operation is shown in the left illustration.

The hole in the index wheel must be true and perpendicular to the rim. It is 4½ in. long and 3⅞ in. in diameter and 0.015 in. of stock is removed. For this job on a Bryant Internal grinding machine a 24-J Crystolon wheel is used size 3x¾x⅞ in. This is shown in the cut on the right.

One of the cylindrical grinding operations is shown in the bottom cut. The machine is a Norton 10x50 in. and the work is a horizontal feed rod 1 in. in diameter by 50¾ in. long. It requires the careful use of steadyrests to produce a finished rod of uniform diameter. The wheel used is an Alundum grain 6624 combination, grade J.

There are many interesting grinding operations in this plant where these Gear Shapers are made and grinding efficiency is the result of selection and experimental work with various abrasives and various combinations of grains and grades of wheels. Efficiency in grinding is always the result of careful selection of the proper wheel. The work of our Sales Engineers is to assist in finding the proper wheel for each job.

Some Uses of Portable Tools in the Machine Shop

Pneumatic Tools as Confined to Machine Shop Use Only—Drills —Scaling Hammers—Grinders, etc.—Electrically Driven Tools— Portable Boring Bar—Heavy Portable Planer—Boring Mill

*By J. H. MOORE

TO fully cover the subject of "Portable Tools, and their uses in the Machine Shop" would take a complete issue in itself, therefore we shall have to content ourselves with a few scattered uses, together with explanatory matter. The term portable tools is a very broad one and embraces many varied lines. Our best plan therefore would be to follow out a clearly defined plan, taking one type of tool at a time. We shall start with pneumatic tools.

Pneumatic Tools

There is a considerable difference between the small repair shop and the large manufacturing plant, but in both cases pneumatic tools are used extensively. There is usually a certain amount of repair or assembly work that is much easier handled by portable tools, than by taking the piece to the stationary machine.

Nowadays it is a poorly equipped plant that cannot boast of at least a few, if not all, the portable tools listed below:—

One or two pneumatic drills; some chipping hammers; and a pneumatic grinder. Of course if we were considering the foundry, boiler shop, etc., we could elaborate still further, but in this present article we will confine ourselves to the uses in the machine shop. Without touching upon the design of such tools in any way, let us consider why they are in such popular use?

Lightness; ease of handling by unskilled labor; ease of repair; ruggedness; low maintenance and operating cost. All these features appeal to manufacturer and worker alike. Their uses are so varied as to almost baffle description, for such tools are used for drilling, reaming, counterboring, tapping, grinding, clipping, cleaning tubes, boring, etc., etc.

Forgetting for the moment all the various uses to which such tools can be put in the foundry, such as cleaning castings and so on, look at Fig. 1. Here we see a scaling hammer trimming the gasket of a pump which has just been assembled. This illustration shows only one of hundreds of uses in the machine shop. Rough edges which have been missed by the foundry are soon leveled down; flanges that are somewhat larger that they should be owing to loose rapping when casting was made are soon brought down to size, and so it goes right down the line, from the first operation, to the time the machine, pump or whatever the product may be, reaches the shipping platform.

Then there is the portable drill, which bores, taps, reams, etc., Apart from the fact that many holes are better drilled at the assembly stage, it is surprising how often holes intended to be drilled on the machine are forgotten. This of course is not so evident when jigs are used at the drilling machine, but every product does not warrant the expenditure of jigs. The time which would be wasted in disassembly, not to speak of the time transporting the part to and from the drilling machine, would be a serious item, but all this is avoided by using the portable drill. In a very short time the error is remedied and with practically no inconvenience.

The same condition holds good in grinding. In many cases the portable grinder puts the finishing touch on an assembled machine, where such an operation would be impracticable, and often impossible, with a stationary grinder.

The air hoist should also be considered as a portable tool because it is one of the means of speeding up production. Where air hoists are installed, men experience less fatigue, and auto-

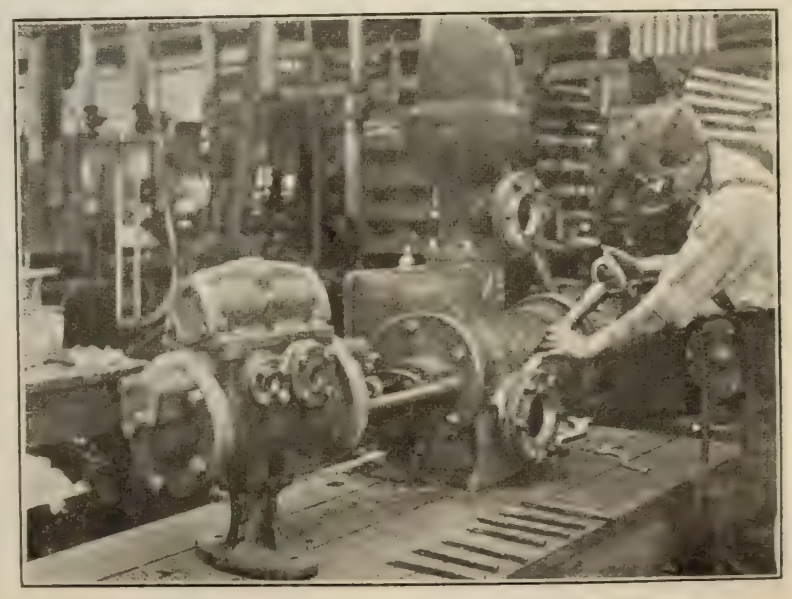

Fig. 1.—Trimming a pump gasket by means of a scaling hammer.

We are indebted to the Canadian Ingersoll Rand Co., Sherbrooke, Que., for the use of Fig. 1; to the H. B. Underwood Co., New York, for Fig. 2; and to the Morton Mfg. Co., Muskegon Heights, Mich., for Fig. 3.

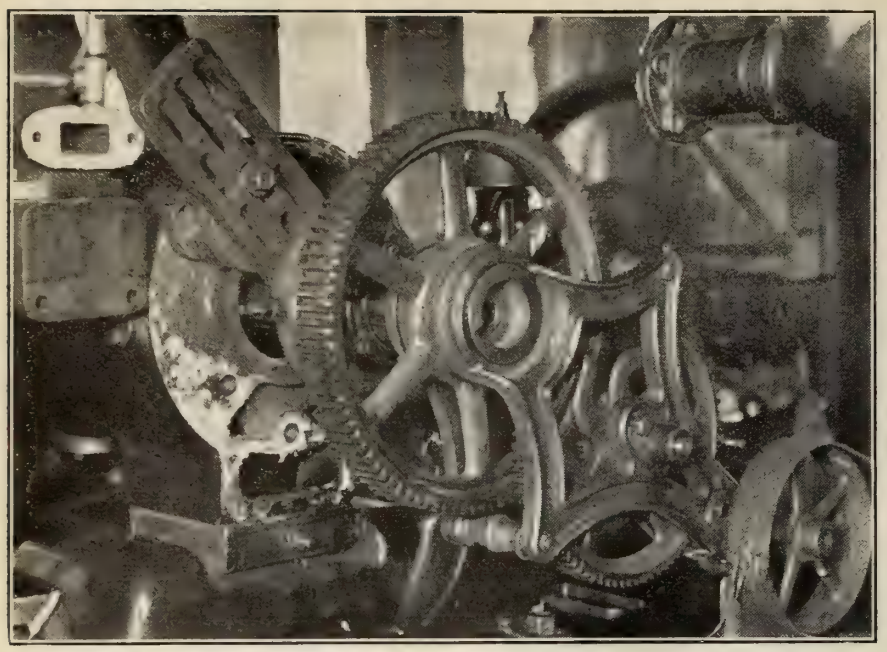

Fig. 2.—A portable cylinder boring bar at work.

matically their productive capabilities increase. An ideal arrangement, especially if the work is of rather heavy nature, is to install an air hoist directly over each machine. When the production does not warrant such a procedure, one hoist of the travelling type can be arranged to serve several machines.

Another useful tool is the blow gun, this being used for such work as blowing dirt and dust from the inaccessible parts of electric motors; cleaning chips and dirt from machine tools, shafting, patterns, work benches, etc., etc. In other words a gun, or nozzle, which, aided by compressed air, reaches spots which are almost inaccessible, and in a rapid and thorough manner.

Then there is the riveting machine. This type of portable tool is very useful in many cases, especially in assembly work, although as a general rule, its use is greatest in construction work, shipbuilding, and boiler manufacture. However there are cases in the machine shop where such a tool is of great value. One could discuss the use of pneumatic tools almost indefinitely, but as we do not wish this article to be of undue length we will pass on to another type of portable tool in use.

Electric Tools

Electrically driven portable tools are much in use and favor throughout machine shops and manufacturing plants. These include such tools as electric drills, grinders, etc. The drills also perform tapping and reaming operations, and accomplish practically the same work as pneumatic drills using electricity as the driving medium. The electric grinder is found to be very useful in the tool room for the grinding of dies, also on the floor for grinding of castings. In fact the uses of these tools are so closely interwoven with that of the pneumatic type, that no further mention need be made. In the one case compressed air is the driving medium, while in the other, electricity supplies the power. Some manufacturers stand firm for the one type, while others swear by the latter mentioned. As we are not out to make comparisons or comments we shall pass to another type of portable tool.

Portable Boring Bar

At Fig. 2 is shown a portable cylinder boring bar busily engaged in boring out the cylinder of an engine right in the plant, without dismantling or disturbing any connections or piping. This type of portable tool is designed for reboring all sizes of steam engine cylinders, pumps, steam hammers, air compressors, large wheels, etc., and is so arranged that it will bore with one or both cylinder heads off. In boring out a cylinder of an engine all that is necessary is the removal of cylinder head and piston. This saves the breaking of steam joints, and so on.

In action, the cutter heads are fed by a steel screw which is let in on one side of the bar. Adjustment of cutting tool is arranged for, and two changes of feed are obtainable. The bar is driven by a train of gears and can be operated either by hand or belt power. In the illustration shown the belt is used as the power medium. However, where power is not available the hand method is quite satisfactory.

Other Portable Tools

While the average shop man's idea of a portable tool is something which he can pick up and carry around, this impression is hardly correct, when one considers the term in a broad sense. For example, we have the portable key at

Elements of Machine Design—Lesson No. 2

Continuation of Lesson Contained in October 20th Issue—Moment of Inertia—Moment of Inertia of a Compound Section—Section Modulus—Various Examples and Solutions

By L. T. RUTLEDGE

CONTINUING our lesson on beams, from the Oct. 20, issue, we find that for equilibrium as stated previously, the moment of resistance of the fibres of the beam must be equal to the bending moment of the external forces acting upon it. When a beam is loaded transversely, it bends about the neutral axis (N. A.) which lies in the centre of gravity of the section. The fibres on one side of the (N. A.) are compressed and on the other side they are stretched. The fibres which are farthest away from the neutral axis are stressed the most, and if the maximum stress does not exceed the elastic limit stress, then the intermediate fibres are stressed in direct proportion to their distance from the neutral axis.

If these stresses are represented graphically by straight lines, the extremities of the lines would be on one straight line, and the stress diagram on either side of the (N. A.) is a triangle with its vertex on the (N. A.) and its base parallel with the outside fibre under stress. Now it is apparent that the total moment of resistance of the beam is equal to the sum of the moments of all the individual fibre stresses about the neutral axis. The number of individual fibre stresses is so large as to be immeasurable and accordingly the work entailed in adding up this large number of separate moments at first sight may appear to be almost an impossibility, nevertheless it has been done and is quite easy when one knows how. We shall now proceed to do what seems so difficult. Let a beam of rectangular cross-section be used for illustrative purposes as is shown in Fig.11.

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should any reader wish help in any problem on mechanical matters, Mr. Rutledge will be only too pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

Let M = the total resisting moment of the beam.
b = the width of the beam.
h = the height of the beam.
c = the distance from the N.A. to the extreme fibre under stress.
s = the stress in the fibre at the distance equal to c.

The variation in stress is represented graphically by the triangle ADO. Consider a very narrow strip on this stress diagram distant z from the N. A. and lying parallel to the N.A. and let it represent the stress on a very narrow strip of the cross-section of the beam which may be represented by

$$\delta A$$

the symbol

$$\delta$$

denoting nothing but that the area is infinitely small.

Now the unit stress at distance c = s (lbs. per sq. in.)

Then the stress at unity distance

$$= \frac{s}{c}$$

The stress at distance z will be

$$= \frac{s}{c} z$$

The total stress on the area

$$\delta A$$

will be

$$\frac{s}{c} \cdot z \cdot \delta A$$

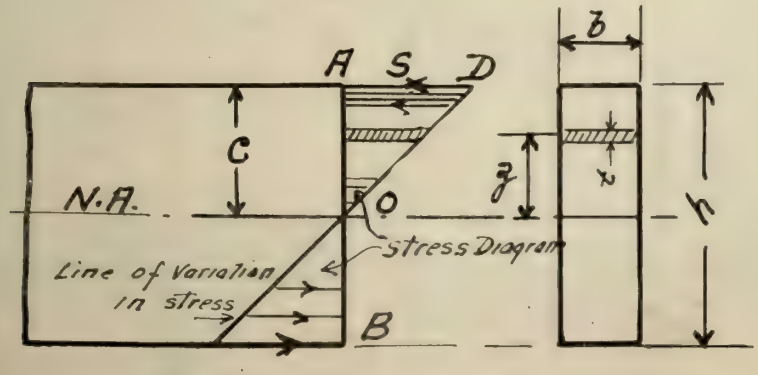

Fig. 11.

The moment of this stress about the N.A.

$$\frac{s}{c} \cdot z \cdot \delta A \cdot z$$

or

$$\frac{s}{c} z^2 \delta A$$

Up to this point we have only considered an infinitely small section of the beam and have found for it the value of the resisting moment. For the entire beam, the moment will be the summation of an infinite number of quantities.

This summation is represented by a symbol

$$\sum$$

put ahead of the formula, so that the entire resisting moment is given by the expression

$$\sum \frac{s}{c} z^2 \delta A \qquad (12)$$

$\frac{s}{c}$ is a constant quantity and can therefore pass through the summation sign. It is not affected no matter what values are assigned to the "z" factor.

So that

$$\frac{s}{c} \sum z^2 \cdot \delta A$$

The quantity

$$\sum z^2 \delta A$$

is an abstract quantity of the fourth dimension since z^2 is a second dimension and area is also a second dimension. It is impossible to visualize this quantity. It is quite easy for the mathematician since he is accustomed to think in symbols. This quantity is called the moment of inertia. The usual symbol employed to designate it is a capital I. So that we have

$$I = \sum z^2 \delta A$$

By substituting in formula (13) the symbol for the moment of inertia we

have the formula written in a simpler form as follows:

$$M = \frac{S}{C} I$$

$$\text{or } \frac{S}{C} = \frac{M}{I}$$

In the above we have the most important formula in machine or structural design, one that is used all the time in design and one that should be remembered. It is the all-important formula used in the design of a skyscraper or in the design of the simplest beam in a common machine.

Moment of Inertia

In the previous paragraph it was shown that the abstract but mathematical quantity known as the moment of inertia and represented by the symbol "I", is a factor of the moment of resistance and is equal to the sum of the products of each elementary area of the cross-section multiplied by the square of its distance from the neutral axis which passes through the centre of gravity of the entire section.

To obtain the moment of inertia of a rectangle of width b and height h about the neutral axis, it will be necessary to divide the section into very narrow strips as is illustrated in Fig. 12. Let "t" represent the thickness of each strip. Its area then is bt. If, as before, z is the distance from the N.A. to the centre of gravity of this elementary strip, then the moment of inertia of the strip is z^2 bt. A value for each strip in the entire section will have to be obtained and then all these values added together. A very little thought on the question will convince one that it will be necessary in order to have an absolutely correct answer to have an infinite number of these tiny strips. If we assume there are an infinite number of these strips then to get the correct sum we should have to employ the mathematics known as calculus. Calculus is a very exact science and by its use we can get the absolutely correct answer. However, by taking a goodly number of strips of measureable width we can get an answer that is very nearly correct, as is illustrated below. The calculus gives the correct answer for the moment of inertia to be 3

$$I = \frac{bh^3}{12} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (16)$$

It is well to note that the dimension that is cubed is always the one that is perpendicular to the axis about which the moment of inertia is taken.

Example: What is the moment of inertia of a rectangle 2"x12" about the neutral axis parallel to the shorter dimension?

Using formula (16) we have

$$I = \frac{bh^3}{12} = \frac{1}{12} \text{x} 2 \text{x} 12^3 = 288 \text{ inches}^4.$$

It is an excellent exercise to apply the approximate method of solution and see how closely the approximate result approaches the answer obtained by the use of the calculus. Let us do this. Divide the section into 24 equal strips parallel to the shorter dimension. The width of each is one-half an inch and its area is one sq. inch. It is now necessary to determine the "z" value for each of the strips, that is, we must know the distance from the N.A. to the centre of gravity of each elementary strip of the whole 24 of them. It must not be overlooked that there are two strips situated the same, one on each side of the N. A. But one would say that one distance is positive and the other is negative. This is true, but then the z is squared and squaring a negative quantity makes it positive. Thus we see that we have to find the moment of inertia for half the sections and at last multiply by 2. The z's for the 12 upper sections are beginning at the centre: .25, .75, 1.25, 1.75, 2.25, 2.75, 3.25, 3.75, 4.75, 5.25 and 5.75.

Now:—then $I = (.25^2 - .75^2 - 1.25^2 - \text{etc.} \ldots.) 1\text{x}2 = 287.5 \text{ ins.}^4$.

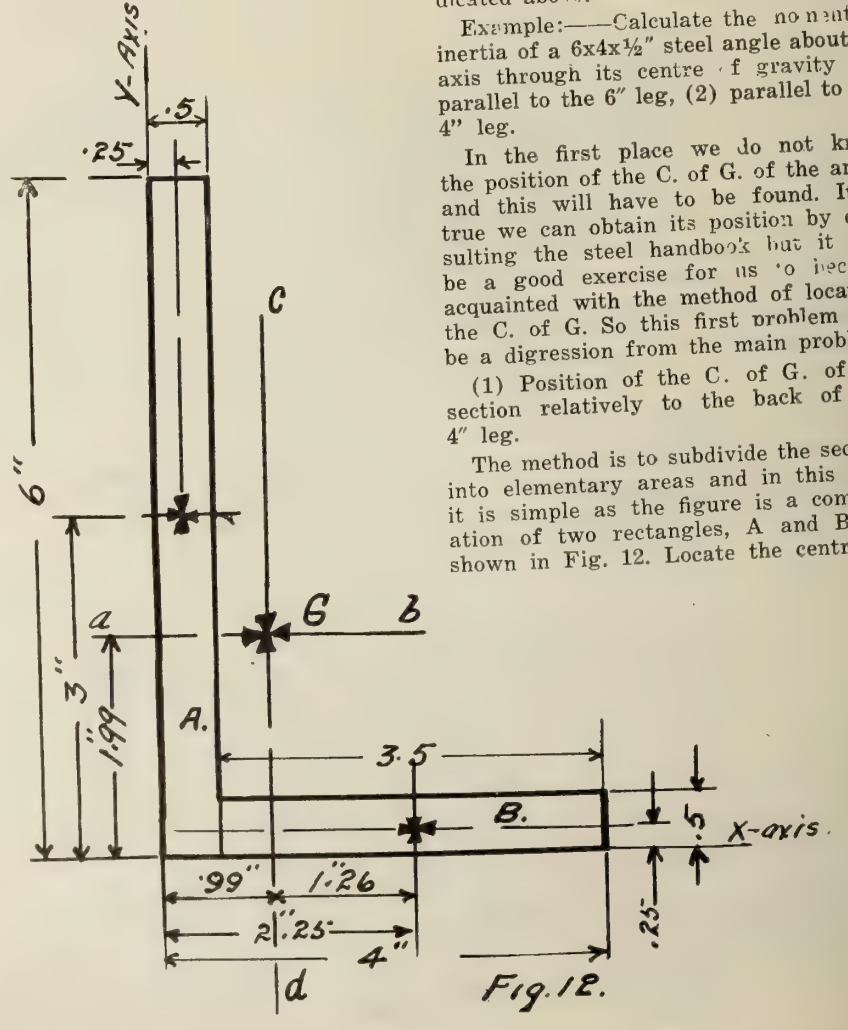

Fig. 12.

The above shows that the approximate result is very close to the correct result, 288.

The employment of similar methods will give the moment of inertia of a triangle and a circle. The values are as follows:

The I for a triangle about its N.A. parallel to the base b

$$= \frac{bh^3}{36} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (17)$$

The I for a circle about an axis through its centre and of

$$\text{diameter } d, = \frac{\Pi}{64} d^4 \quad \ldots\ldots\ldots\ldots \quad (18)$$

Moment of Inertia of a Compound Section

The moment of inertia of a compound section about an axis through its centre of gravity is equal to the sum of the moments of inertia of the component parts about axis through their own centres of gravity plus the areas of the component parts multiplied by the squares of the distances of their individual centres of gravity from the N.A. Then the moment of inertia of any section, no matter how complex, can be found by dividing the compound section into elementary rectangles, triangles, etc., and the total I can be found as indicated above.

Example:——Calculate the moment of inertia of a 6x4x½" steel angle about an axis through its centre of gravity (1) parallel to the 6" leg, (2) parallel to the 4" leg.

In the first place we do not know the position of the C. of G. of the angle and this will have to be found. It is true we can obtain its position by consulting the steel handbook but it will be a good exercise for us to become acquainted with the method of locating the C. of G. So this first problem will be a digression from the main problem.

(1) Position of the C. of G. of the section relatively to the back of the 4" leg.

The method is to subdivide the section into elementary areas and in this case it is simple as the figure is a combination of two rectangles, A and B, as shown in Fig. 12. Locate the centre of

gravity of each of the rectangles. It is at the intersection of the diagonals.

Consider each rectangle as a weight and apply the principle of moments.

Take moments about an arbitrarily selected axis, say, the axis of X. The moment of one of these weights is the product of the measure of it, that is, the area of the rectangle, into the distance of its centre of gravity from the axis of X. Also we know that the moment of the compound section is the sum of the moment of the individual parts.

Let y be the distance from the X-axis to the desired C. of G.

The total area of the section is

$(6x½) + (3.5x½) = 4.75$ sq. ins.

Then we have

$$4.75xy\ (6x.5)x3+(3.5x.5)x.25$$

$$\text{therefore } y=\frac{9.4375}{4.75}=1.99 \text{ ins.}$$

Similarly the distance X which is the distance of G from the Y-axis may be found.

$$4.75xX= (6x.5)\ x.25+ (3.5x.5)\ x2.25$$

or $X=.99$ ins.

Thus the centre of gravity of the section is fixed and we can proceed with the second part of the problem.

(2) The moment of inertia of the compound section about an axis through its C. of G. and parallel to the back of the longer leg, that is parallel to the axis cd.

For rectangle (a)

I about an axis through its own C. of G. and parallel to axis cd

$$\text{is } \frac{b\ h\ 1}{12\ \ 12}=\frac{}{}x.5^3x6=.06 \text{ ins.}^4$$

Area of this rectangle into square of distance of its C. of G. from the axis cd $=3.0x.74^2=1.64$ ins^4.

For rectangle (b)

Its I about an axis through its own C. of G. and parallel to axis cd is

$$\frac{1}{12}x.5x3.5^3=1.79 \text{ ins.}^4$$

Area of the rectangle into square of the distance of its C. of G. from the axis cd $=1.75x1.26^2=2.78$ ins.^{4}

The total moment of inertia equals the sum of the above four quantities that go to constitute the whole

$.06+1.64+1.79+2.78=6.27$ ins.^{4}

By a similar method of calculation the moment of inertia of the section about the axis ab can be found and when so worked out the answer will be found to be 17.4 ins.^{4}.

The difference in these two values of the moment of inertia is a criterion as to which way the angle should be placed to carry the greater load. If it is placed so that the axis ab is horizontal and the quantity 17.4 then becomes a factor of the resisting moment, then the resistance is greater than if the other "I" had been used. Accordingly a greater B.M. can be applied to the angle and that means a greater load.

Section Modulus

In the theory of the beam there is one more abstract quantity that we must become acquainted with before we begin working difficult practical problems.

The usual way of expressing the beam fixture formula is

$S/C=M/I$. Now let us change it around to read

$M/S=1/C$.

The quantity I/C which is the moment of inertia divided by the distance from the neutral axis to outside fibre which is the one stressed equal to S is called the section modulus. The symbol capital Z is used to designate it. It is a handy quantity to have in design and saves dividing the I by C. The section modulus for all the standard structural shapes is given in the handbooks. It is a good idea to have a table of section moduli for all the ordinary sizes of beams made in wood. One has to make this table up himself.

Using the section modulus, the flexure formula becomes

$M/S=Z$ or $M=SZ$ or $S=M/Z$ (19)

Example:—Find the section modulus of a 2" x 12" wooden beam, considering the axis as being parallel to the shorter dimension.

The section modulus for a rectangle $=I/C=\frac{bh^3}{12}$

divided by C which is h/2. Therefore the section modulus is eual to 1/6 of bh^3.

In this problem then the section modulus $=Z=1/6 \times 2 \times 12^2=48$ ins.^{3}

Example:—Why is it better design to load a 2" x 12" pine beam with the 12" dimension the vertical one with the 2" one vertical.

With the governing axis parallel to the 2" side we have

Modulus $=Z=1/6 \times 12^2=48$ ins^3.

With the governing axis parallel to the 12" side, we have

$Z=1/6 \times 12 \times 2^2=8$ ins.^{3}

The above calculations show that the beam is 6 times as strong when placed with the longer side vertical, it being inferred that the load would be so placed that its action would be vertical. Everyone of us will have noticed that the joists are so placed to sustain a floor of the building.

Exercise 4;—A rectangular pine beam resting on two supports 10 ft. centre to centre is loaded with a concentrated load at the centre of the span of 4000 pounds. What section of beam is required in order that the working stress may not exceed 800 lbs. per sq. inch.

For equilibrium the resisting moment has to be equal to the bending moment. The B.M. for a beam centrally loaded with concentrated load is

$\frac{WL}{4}$

according to formula (11).

Then for equilibrium,

$$M=\frac{WL}{4}=\frac{4000 \times 120}{4}=120000 \text{ inch-lbs.}$$

the length being 10 ft., which is 120 inches. Since the stress is given in bounds per sq. in., we have to use inches throughout.

Now using the flexure formula (19)

$$Z=M/S=\frac{120000}{800}=150 \text{ ins.}^3$$

For a rectangular beam $Z=1/6 \times bh^2$.

If $bh^2—6 =150$ then $bh^2=900$.

Now both b and h are unknown, then we must assume one of them to find the other as we have only one equation and one equation will solve for one unknown only. As a first trial assume b equal to 4 the h^2 will equal 225 and extracting the square root to find h we get $h=15$. As a second trial assume $b=6$, then $h^2=150$ and $h=12.5$ about. Either a beam 4" x 15" or one 6 x 12.5" will be strong enough but it will be observed that it will be more economical to use the 4" x 15" beam since there is a smaller number of board feet in it.

The following are typical problems employing the principles laid down in the above theory on the beam. It is recommended that the student try them.

1. Determine the centre of gravity of 5 x 3" angle.

2. Determine the location of the centre of gravity of a chord section composed of

Two 16" channels at 33lbs. weight 19.80 lbs.

One 24" x ½" cover plate weight 12.00 lbs.

the channels being placed back to back and 17" apart inside.

Answer:—The centre of gravity is located on the vertical centre line 4.83 inches from the top of the cover plate

3. Determine for the section given in problem 2 the moments of inertia about an axis through the C. of G. parallel to the cover plate and about an axis through the C. of G. parallel to the back of the channels.

Answer: For the first part 1642.46 ins.^{4}

Answer: For the second part 3249.17 in.

4. A cantilever beam projecting 8 ft. from a wall is required to carry in addition to its own weight a uniform load of 900 lbs. per linear foot. Assuming the beam to weigh 50 lbs. per lin. ft. determine the necessary steel 1-beam. The allowable working stress used with steel beams is 16000 lbs. per sq. in.

Answer: A 10" 1-beam at 25 lbs. will be strong enough.

5. A forging weighing 15 tons is to be carried temporarily on three steel beams resting on supports 8 ft. c. to c. Assuming a uniformly distributed loading, design the temporary structure.

Method of Recooling Oil From Quenching Tanks

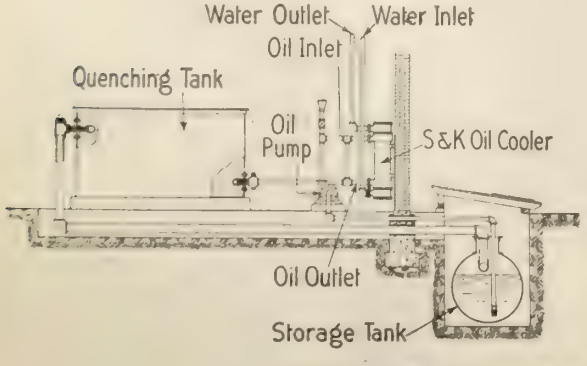
Proper Speed of Cooling is Determining Factor in Degree of Hardness Obtained—Temperature Should be Decided Upon—Then Quenching Medium Should be Maintained At that Point

*By S. E. DERBY

IF STEEL is heated through its critical range, the internal structure or molecular arrangement of the steel is transformed into the hardening condition. If thereupon the steel is quenched or quickly cooled in a suitable manner, this hardness is partially or wholly retained. Obviously a large piece of steel, even though at the same initial temperature as a small piece, will take longer to cool to room temperature because a greater time is required for the heat from the interior to flow to the surface where it is removed. The rate of cooling thus depends upon the size of the metal. It also depends upon the composition of the steel, and to a greater degree upon the rapidity with which the cooling or quenching medium removes the heat. This rapidity is determined by the nature of the medium, its fluidity or viscosity, specific heat, and temperature.

The quenching mediums generally used are water, brine and oil. In order to obtain the best hardening results with either of these, a low bath temperature is desirable. An excessively high temperature brings about the formation of vapor bubbles or pockets and these bubbles adhere to the hot steel and prevent uniform cooling and therefore the attainment of a uniform degree of hardness. Furthermore under these conditions the time of cooling is materially lengthened. In the case of mineral oils of low fire point, if the temperature is relatively high, the oil breaks up into various distillation products leaving a residue or precipitate that causes the oil to thicken, corresponding to a greater viscosity and therefore a diminished ability to dissipate heat by convection. The formation of residue in the oil tends to make the oil heat up quickly and for this reason its efficiency as a quenching medium is impaired. Now and then the thickening of the oil and the accompanying sluggishness with which the heat is dissipated frequently result in fire.

The particular temperature that will give the best hardening results should be ascertained first and then this temperature maintained by means of a suitable cooling system. G. W. Pressell of E. F. Houghton & Co., found that by heating in an electric furnace up to 1,200 F. a test piece of low carbon chrome vanadium steel of special construction, and thereupon quickly immersing it to a constant depth in 25 gallons of quenching liquid, and measuring the time required for the steel to cool from 1,200 to 600 deg. F., the quenching speed varied considerably with the initial temperature of the bath.



The results obtained for the various oils used are abstracted in the accompanying table.

The reader will note the wide variation in the case of some of the oils used. For this reason it is necessary that the temperature at which the best hardening results are obtained be first determined by test and then provisions made for maintaining this temperature constant throughout the quenching bath. For this purpose some sort of oil recooling system is used. Although several methods of recooling the quenching oil are in use, nevertheless modern practice favors circulating the oil in a closed circuit and recooling the oil in a separate cooler, as for example the typical arrangement shown in Fig. 1.

The heated oil is removed from the top of the quenching bath and passed through a suitable strainer to a storage tank. From here it is forced by means of an oil pump to the cooler, wherein the oil is cooled and thereupon returned to the quenching tank. The oil cooler, see Figs. 2 and 3 for typical arrangements, frequently consists of a smooth bore cylindrical cast iron shell, to the ends of which are attached cast iron headers. Within the shell is a bundle of straight brass or copper tubes through which cold water passes from one header to the other. The headers are separated from the cylinder by the tube sheets.

The hot oil flows into the shell at the top, as shown by Fig. 3, passes transversely across the tubes and around the annular baffles, and leaves the shell at the bottom. During its travel through the shell, the oil strikes the tubes approximately at right angles, thereby splitting into many fine streams. The water flows through the tubes in an opposite or counter-current direction to the oil. The tube sheets are built of a composition metal into which the tube ends are cast. Thus it is possible to choose

*Author is connected with Schutte & Koerting Co., Philadelphia, Pa. Article is copyrighted.

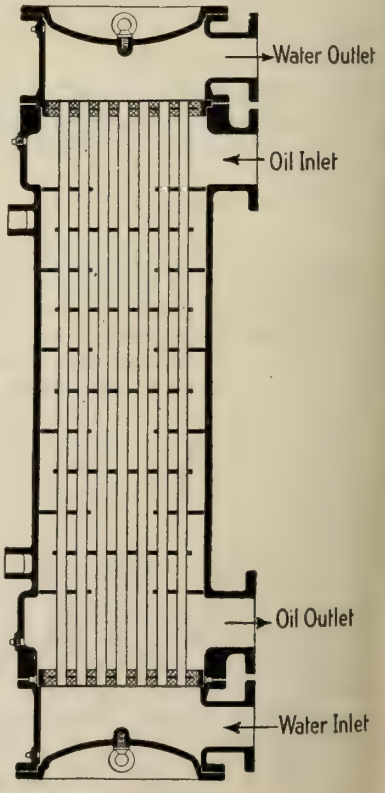


Fig. 1. A system for recooling the oil from quenching tanks. Fig. 2. A typical oil cooler. Fig. 3. Sectional elevation of a typical oil cooler.

the number, shape, size and spacing of the tubes so that a large cooling effect is obtained. The upper tube sheet is rigidly secured to the shell; the lower one forms a floating head construction, thus making provision for the expansion and contraction of the tubes. Each tube experiences the same expansion, and for this reason there is no tendency for the tubes to become loosened, or for the tube sheets to be strained. The composition material of the tube sheets is exceedingly dense, and its melting point is around 550 deg. F. It does not disintegrate at the temperature met in practice.

The packing between the headers and the shell consists of two rings of rubber separated by one of brass and practically prevents any mixing of the oil and water. Since all joints on the cooler are external, leakage is quickly detected. The entire tube bundle is readily removed from the shell without breaking any of the oil connections, thereby facilitating inspection and cleaning. (See Fig. 4.)

It will be noted that the oil pipe enters the quenching tank at the bottom, whereas the overflow pipe leaves the tank at the opposite side and at the top. This arrangement makes for a thorough diffusion of the oil through the tank, and for a maximum cooling during quenching. The evident advantages derived from the use of an oil-cooler are the maintenance of a uniform temperature throughout the quenching bath, uniform hardening results, saving in time, saving in oil and elimination of fire risk

When the quenching oil is continuously circulated and recooled, the temperature of the bath can be closely controlled and kept sufficiently low, thereby preventing the formation of vapor bubbles and soft spots on the surface of the hot steel. It is not necessary to discontinue quenching periodically, in order to prevent the oil from overheating. Adequate cooling is insured at all times and time is saved because the cooling operation becomes a continuous one. A smaller quantity of oil can be used and large capacity quenching tanks are unnecessary. Evaporation losses and the formation of oil sludge at the bottom of the tank are reduced to a minimum. Since the temperature of the bath is always kept comparatively low, and oil having a low flash point can be used. The danger of oil igniting, as in a poorly ventilated hardening room, is eliminated.

In a large steel plant near Philadelphia, the following results were obtainer with the type of cooler shown in Fig. 2.

A No. 3 Gould pump, driven by a 5 H. P. G. E. motor, was installed for pumping the oil to the quenching tank and for forcing it through the cooler and thence back into the tank, thus com-

WELDING AND CUTTING

Learning To Weld—Some Points for Beginners

Possibilities of Brazing—Use of Welding Rods—Why Fluxes are Used—Sheet Aluminum Welding—Composition of Fluxes—The Question of Eye Protection—Progress in Welding

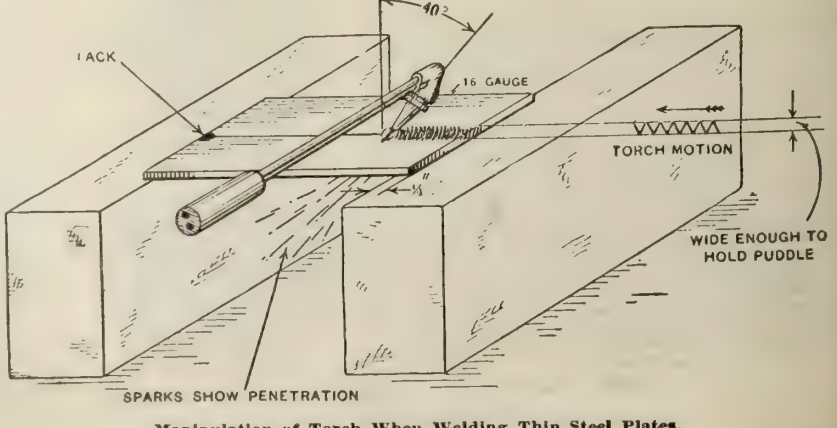
By FRED E. ROGERS

IN THE Oct. 20 issue of Canadian Machinery we spoke on the subjects of preheating, when to preheat, protecting the weld, penetration, proper size of tip and flames, welding speeds and method of testing welds. In the present materials we will consider some further points of interest. Let us start with brazing.

Brazing.

The welder should not disregard the possibility of brazing with the oxy-acetylene torch. Brazing is a valuable process which should be used in some cases instead of welding, and the welder should exercise judgment to determine whether brazing or welding is the preferable method. It is true that the oxy-acetylene flame may be used for welding all metals but in those cases where the high temperature might seriously distort or deteriorate the metal or adjacent parts of an apparatus it may be advisable to resort to brazing, especially in the case of brass or malleable iron. A brazed joint well done is very strong, and it is a question whether it is not preferable in most cases to braze brass rather than to weld it. In the case of malleable iron, brazing with bronze welding rod is recommended for general repairs because malleable iron loses its malleable characteristics when molten and welded whereas when brazed its malleable quality is not seriously affected, and the brazed joint will be nearly as strong as the parent metal.

When using the torch for brazing, the flame should be made slightly carbonizing, and it should be held away from the metal to avoid concentrating the heat and to raise the temperature only to the point required to fuse the spelter. The parts should be cleaned and fitted together as closely as possible, and clamped to hold them firmly while being brazed. The welder need have no fear of clamping parts too closely as the molten spelter will penetrate the most closely-fitted joint when properly fused and fluxed. As a matter of fact, the closer the joint the stronger the job when brazed.



Never attempt to weld a previously brazed joint without cutting away all of the brazed metal. Spelter will seriously weaken a weld, and all traces must be carefully cut away before starting to weld. This rule should be scrupulously observed. Brazing is a form of soldering, in fact it is called hard soldering, whereas welding requires fusion of the metal itself, and it is essential for sound work to incorporate only weld metal of the same physical characteristics as the metal to be welded.

Welding Rods.

Adding material, welding rod or filler is necessary to fill the joint and build up the level of the weld flush with or slightly above the margins. Pure wrought iron or low carbon steel wire is used in steel welding; cast iron sticks, for cast iron; aluminum wire, for sheet aluminum; aluminum sticks, for cast aluminum; bronze wire, for bronze; monel wire for monel; and so on. The rule is to use rods of the same metal as the metal to be welded and of the same physical structure. Rolled or drawn welding rods should be used for rolled metals and cast rods for castings.

Ordinary commercial steel wire or cast iron sticks cannot be used successfully for welding, however, because of impurities present that seriously affect the strength when fused in a weld. Sulphur, phosphorous and carbon in excess of certain percentages make weak castings. Commercial wire is strong because of the method of manufacture, the bad effects of high sulphur and phosphorous being offset by the refining process of drawing. But when the metal is molten and cast as it is in a welded joint it is likely to be brittle and weak. The same condition holds with cast iron. Foundry iron used for machine castings is unsuitable for cast iron welding sticks. It is too low in silicon to work freely and is likely to harden or make hard spots in welds that ruin cutting tools when machined.

Swedish wrought iron welding rod was used and recommended exclusively for all steel oxy-acetylene welding in the early days of the industry, and there are still some welders who advocate it to the exclusioon of other material. In general, however, welders have discovered that pure wrought iron welding rod is not necessary or even desirable for the general run of welding. The reason is substantially this: The first welders did not fully understand the theory of torch and welding rod manipulation and usually melted the rod with the direct heat of the torch, whereas up-to-date welders know that the heat of

Manipulation of Torch When Welding Thin Steel Plates.

the puddle should fuse the welding rod —not the direct flame of the torch. The fusing temerature of pure wrought iron rod is approximately 2780 degrees F. while the fusing temperature of 0.10 carbon steel welding rod is about 2,600 degrees F., and hence the difference in temperature of the two carbon steels is approximately 100 degrees, which is ample for welding purposes. Too great a difference is undesirable in any welding combination. It means that if the correct process of welding is carried on that the parent metal must be overheated in order to fuse the adding material. The tendency then is to melt the rod directly with the heat of the flame and thereby injure the quality of the weld.

The welder should avoid the use of any but welding rods furnished by reputable concerns that specialize in these supplies. The money saved in buying low-grade welding material will be lost and much more through poor welds and excessive gas consumption.

Fluxes.

The purpose for which fluxes are used is to dissolve oxide and eliminate foreign matter which if left in the weld metal would weaken it. Flux is not required for welding low carbon steel or cast aluminum but should be used on cast iron, brass, bronze, sheet aluminum, etc. But Deebee flux may be used to advantage on cast aluminum and thus render the use of a puddling spoon unnecessary. Whether a flux shall be used will depend on the situation and whether a puddling spoon can be used to better advantage.

Flux is generally applied by thrusting the hot welding rod into the flux box which transfers sufficient amount to ordinary width joints. On heavy cast iron welding it will be necessary to apply flux more liberally, and it should be dusted on by hand, a teaspoonful at a time.

Sheet aluminum welding is more or less a specialty, requiring experience and skill. The difficulty of the work is largely eliminated by using Napolitan flux, a result of many experiments made to produce an aluminum flux that facilitates welding and produces no bad after affects. The latter consideration is highly important. Corrosive action may cause aluminum welded joints to separate in use when unsuitable fluxes have been used for welding. Fluxes should be used sparingly and on the molten metal only where needed. Avoid wasting flux by throwing it carelessly over the metal where not required. Also protect fluxes from the air when not in use, always keeping them in tightly-covered containers.

The composition of the common fluxes is no secret, and many welders have undertaken to compound their own but with unsatisfactory results in the main. Reasons are that flux manufacture is a specialty requiring care in the selection of materials and compounding to secure commercial purity, correct proportions and intimate mixing. A welder rarely has the delicate scales and the mixing machinery required to compound the materials in correct proportions, nor the experience in buying chemicals necessary to secure the quality of goods necessary. The best advice that can be given to a welder in regard to supplies in general is to buy them from concerns that have made a reputation, and to devote his efforts to his own specialty which is welding.

Eye Protection.

Colored glasses in the spectacles and goggles worn by oxy-acetylene welders too often are chosen without due regard to eye comfort and efficiency. Welders sometimes suffer from eye strain because the colored glasses are not fitted to their eyes. The glasses may not shut off the injurious violet rays sufficiently, or they may exclude too much of the light. In one case the welder suffers from glare and in the other he works in semi-darkness. Either condition militates against sound work as the operator is unable to see clearly what he is doing.

A principle to be borne in mind in selecting colored glasses for spectacles or goggles is to get those suited to each individual, which stop off no more of the light rays than absolutely necessary for eye welfare. The welder who can see the puddle and the margins clearly is able to work more surely and with less waste effort than he who sees things indistinctly, and works by feeling rather than by eyesight.

As a rule men of the brunette type having dark eyes require less eye protection than of the blonde type, having gray or blue eyes.

Some Points to be Considered.

When preparing to weld a broken machine member the parts should be lined up and supported so that they will not shift or change their relative positions while the work is in progress. It is usually less tiresome to put small parts on a work bench or other support before which the operator can stand and work with his torch at the waist level than to weld them on the floor.

Never attempt to weld broken parts of a machine in place unless free to change shape. Expansion and subsequent contraction will throw the parts out of line and perhaps break another part of the machine. If machine parts contain bolt holes care should be taken to line the parts up so that when welded the holes will be in the same position as before. It is advisable in such cases to assemble the broken parts and mark off the holes on paper or metal before starting to weld; or a better method is to make a tram and prick-punch the parts while cold to the tram points. When welded and cooled off the tram points should drop into the punch marks as before thus indicating that the overall dimensions have not changed.

Remember that welds should not be made in wrought iron, and steel thicker than ¼ inch without beveling the edges, or in other words, preparing for welding. Beveling may be done mechanically or with the torch by breaking down square corners. If the corners are broken down by the flame the edges should be separated more than when beveled before-hand. Welds in boilers, drums, tanks and all pressure containers should never be undertaken by any but experienced welders, and then only with the consent of the state and local authorities. In all cases it is advisable to consult the engineering department of the Davis-Bournonville Company before undertaking welding of tension parts having a comparatively low safety factor when failure in use might cause loss of life and damage to property.

When cleaning torch tips never use a steel wire which might roughen the sides of the hole. Use a copper or other soft metal wire instead.

Never use the torch head to knock work into position nor use the torch as a lever for any purpose. Gross value like this is the cause of many complaints.

Keep the hose free from kinks and contact with hot metals. Test occasionally while under pressure with soapsuds to discover leaks, or close the needle valves and release the regulator screws. If the working pressure gauge falls off rapidly it betrays a leak. Never continue to use a leaking hose as it is wasteful and dangerous

Always use a sparklighter for igniting the gas in preference to matches or an open flame. Keep tips in a covered container preferably of wood with holes bored for each tip to preserve from injury and dust. Welding rods should be kept in a dry place to protect from rust. A rusty dirty rod is not good for a weld.

Don't throw short pieces of welding rod away. Weld them to a long rod and use up entirely. There is no need of wasting an ounce of any kind of rod.

Progress in Welding.

Welding requires the exercise of physical and mental faculties in a manner and to a degree experienced in few other trades. The mature learner of welding usually acquires considerable ability to manipulate the torch and produce fair welds after four or five days of practice. But later he may find that his skill has deteriorated and that he is not able to do as well as he was at the end of the first week or ten days of training. This is discouraging, and a new operator feels like giving up in disgust. The experience is common, however, to all learners of a new trade; a plotting of an individual's development of skill will almost invariably show a steady rise for the first two weeks and then a sudden dropping off. From the low point the rise in the scale of ability will be gradual but definite, and no recurrence of falling off will be experienced provided the person keeps in practice. Hence the user of the oxy-acetylene welding torch who finds that he cannot do as good work after two weeks of practice as he did in the first week need not feel discouraged.

Grinding and Measuring Involute Gear Tehet

Gear Blank Shape is Important—Advantages of Hardened Gears —Grinding the Teeth — Method of Operation — Centering the Tool — Various Diagrams — Testing the Teeth — Production

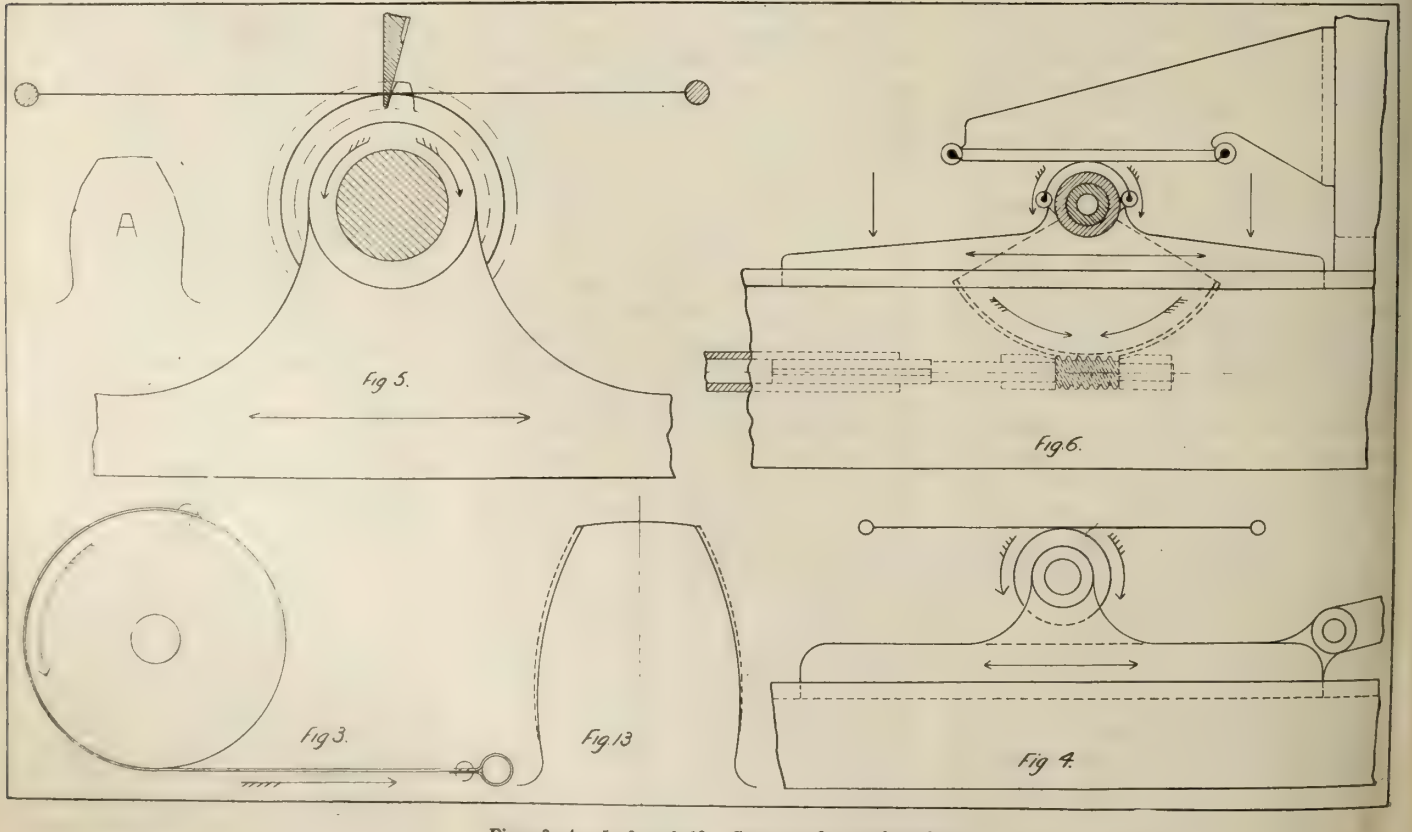
* By E. J. LEES

MODERN machines, in which gears are used, are now being equipped with hardened gears. This is especially true of drives that have to carry a large torque load, and of course holds true of the automobile transmission, but it is also true that machine tool makers and other manufacturers of machinery are coming more and more to realize that the present demand in a gear drive is one that will stand up under severe load. Having hard teeth will be more efficient because the hard surfaces of the teeth will transmit power better, and not deform the tooth profile, causing friction, irregular motion and loss of power.

This being the case it is very important that the gear blank be machined very accurately in all the operations, and particularly so when cutting the teeth, because after it is once hardened the outline and size are fixed, and can not then be recut on the gear cutter. And even if the gear has been made correct up to the point of hardening, there is no assurance that the blank will go through this operation and retain the accuracy, because it may swell or shrink, or it may distort from a plane surface, or become oval, or eccentric or cam shaped.

From a paper presented at the annual fall meeting of the Society of Industrial Engineers, Springfield, Mass., Oct. 5-7, 1921. The authors are consulting engineers, Frank B. Gilbreth, Inc., Montclair, N. J.

After the gear is hardened it is necessary to grind the bore and if the gear is distorted it is only possible to chuck it approximately correct, or in other words an average of the errors in the gear and in the pitch circle. And should the machining be correct, and the hardening come out true, or substantially correct, there is still the human judgment operation of rechucking to grind the bore, and this may be incorrectly done. So it is very evident if the teeth on a gear can be ground that this grinding process will eliminate all of the foregoing troubles.



When it is known that the gear is going to be first hardened and then ground, the machining of the teeth is then not important, and only a roughing out is required, also when chucking to grind the hole, great accuracy is not required.

Advantages of Hardened Gears

The advantages of using hardened and ground gears are that no matter how irregular the blank was before, or after hardening, it can be corrected by grinding. That as the bore is the first part of the gear to be ground, all other grinding operations are then controlled from the bore and will be true and concentric with it. That the teeth can be ground very accurately and held to very close limits, as this is the final work on the gear. And last the smoothness and correct action of the teeth result in a gear, that is not only efficient but quiet.

We now come to the real problem, which is to construct a gear grinder that will first grind the face of the teeth smooth; second, grind this face in a true involute, or modification thereof, and third index the gear to insure correct spacing of the teeth, as well as operate rapidly and easily and be capable of ready adjustment. Such a machine is now in actual use in one of our largest automobile plants, and in the matter to follow I shall describe and relate some of the remarkable results obtained by it.

Before going into the details of construction attention is directed to Fig. 1 which shows the machine at an angle from the front. This machine is known as the Lees-Bradner No. 10 gear tooth grinder. Based on the involute system

Figs. 3, 4, 5, 6 and 13. See text for explanation.

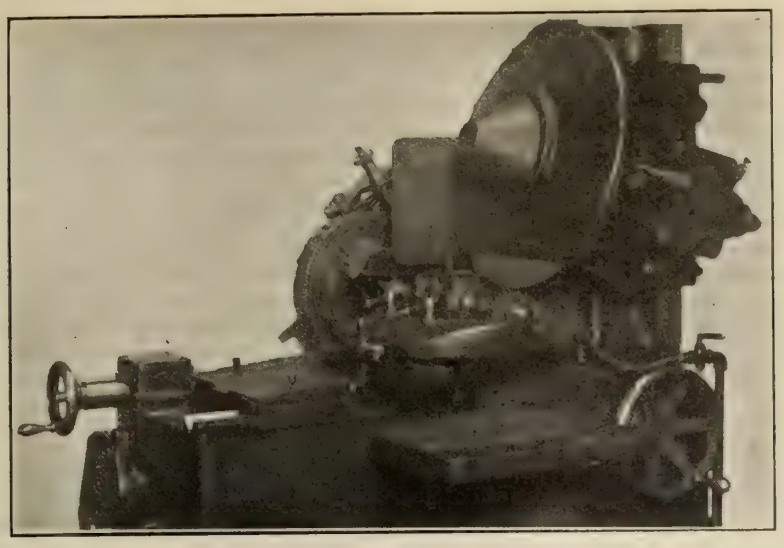


Fig. 1.—General view of machine.

it is possible to grind spur gears from 14½ to 24 degrees angle of pressure; any pitch from 12 to 3 diametral pitch; and from 2″ to 12″ pitch diameter. An emery wheel of 30″ diameter with a planular grinding face is used. The wheel is supported on a stationary column, and the work is travelled past the wheel by a slide having a reciprocating action. The work is given a rotary together with a correct sliding motion, in order to obtain the desired profile action, relative to the plane face of the wheel. A segment equal to the pitch diameter of the gear to be ground is used in conjunction with tapes or bands to obtain this combined sliding and rolling action. These segments can be modified in various ways to obtain any desired change in tooth profile.

A diamond is used to true the face of the emery wheel. This diamond is both lever and screw controlled, and of course travels in a plane line to keep the plane face of the emery wheel true, it is used in conjunction with the emery wheel micrometer feed. The drive to the wheel is by an endless belt, self contained on the machine. This belt is guided by two idler pulleys which are carried in a bracket, with sliding adjustment on the back of the column, to suit any diameter of gear being ground. A single belt is used to drive the machine from a line shaft, but a motor drive may be substituted. The indexing is by means of hardened and ground plates, secured to the work spindle and completely shielded inside a case. The indexing is automatic and takes place at one end of the slide reciprocation.

Setting the wheel at the proper angle is accomplished by means of a worm and segment on the swivel head. There is a pump and connections for supplying the coolant. The work can be held between centres, or supported on a mandrel having a taper shank to fit the spindle and supported at the outer end by the tailstock. To grind an involute tooth profile correctly with the above type of machine, it is necessary that the gear blank and grinding wheel have perfect co-acting motion of generation.

Why is it so difficult to accomplish the perfect generation of a gear tooth on any type of machine? The answer is that ordinary mechanisms do not obtain an absolutely uniform unbroken velocity ratio between the tool and the blank. Any irregularity in this motion generates a broken or incorrect profile. In all machines which generate with a tool that must be centered there is always the chance of error and producing what might be called a ratchet or lopsided gear. Also any tool which has a lapsed intermission in its generating action can not of necessity make a perfectly smooth profile but only an approximate outline composed of small irregularities or waves. So we have three important conditions that are necessary to generate a perfect involute:

1st—the uniform motion between the tool and blank. 2nd—elimination of centering the tool and blank. 3rd—continuity of action between the tool and the gear tooth profile.

Fig. 2 shows two discs in rolling position. We can conceive of their being made so accurate that their rotating motion and velocity would be nearly perfect and much more accurate than gears. Fig. 3 shows one disc and a tape attached for converting sliding motion into rotary motion This, it will readily be seen, is a much smoother and uniform motion than making the conversion by other means such as a rack and gear. Therefore a disc or segment and a tape are probably the most accurate method of obtaining a correct rotating and sliding connection. The use of tapes and segments is old, but they have been used as shown in Fig. 4, where the power is applied to the work slide as reciprocating action and this reciprocating action is transferred into rotary motion of the work spindle by the tapes. Now the weak point in this construction is that under ordinary conditions and care of the average operator, the bearings may not be perfect as to diameter fits, or end thrust tension adjustment, and these conditions coupled with the fact that a tape has more or less flexibility, will result in an error of irregular transmission of motion in a retarded and accelerated form, which will produce a profile having flats or other imperfections on the gear tooth being ground, such as is shown exaggerated in diagram outline to illustrate the result, (see Fig. 5) tooth A. The solution of this problem is as follows:

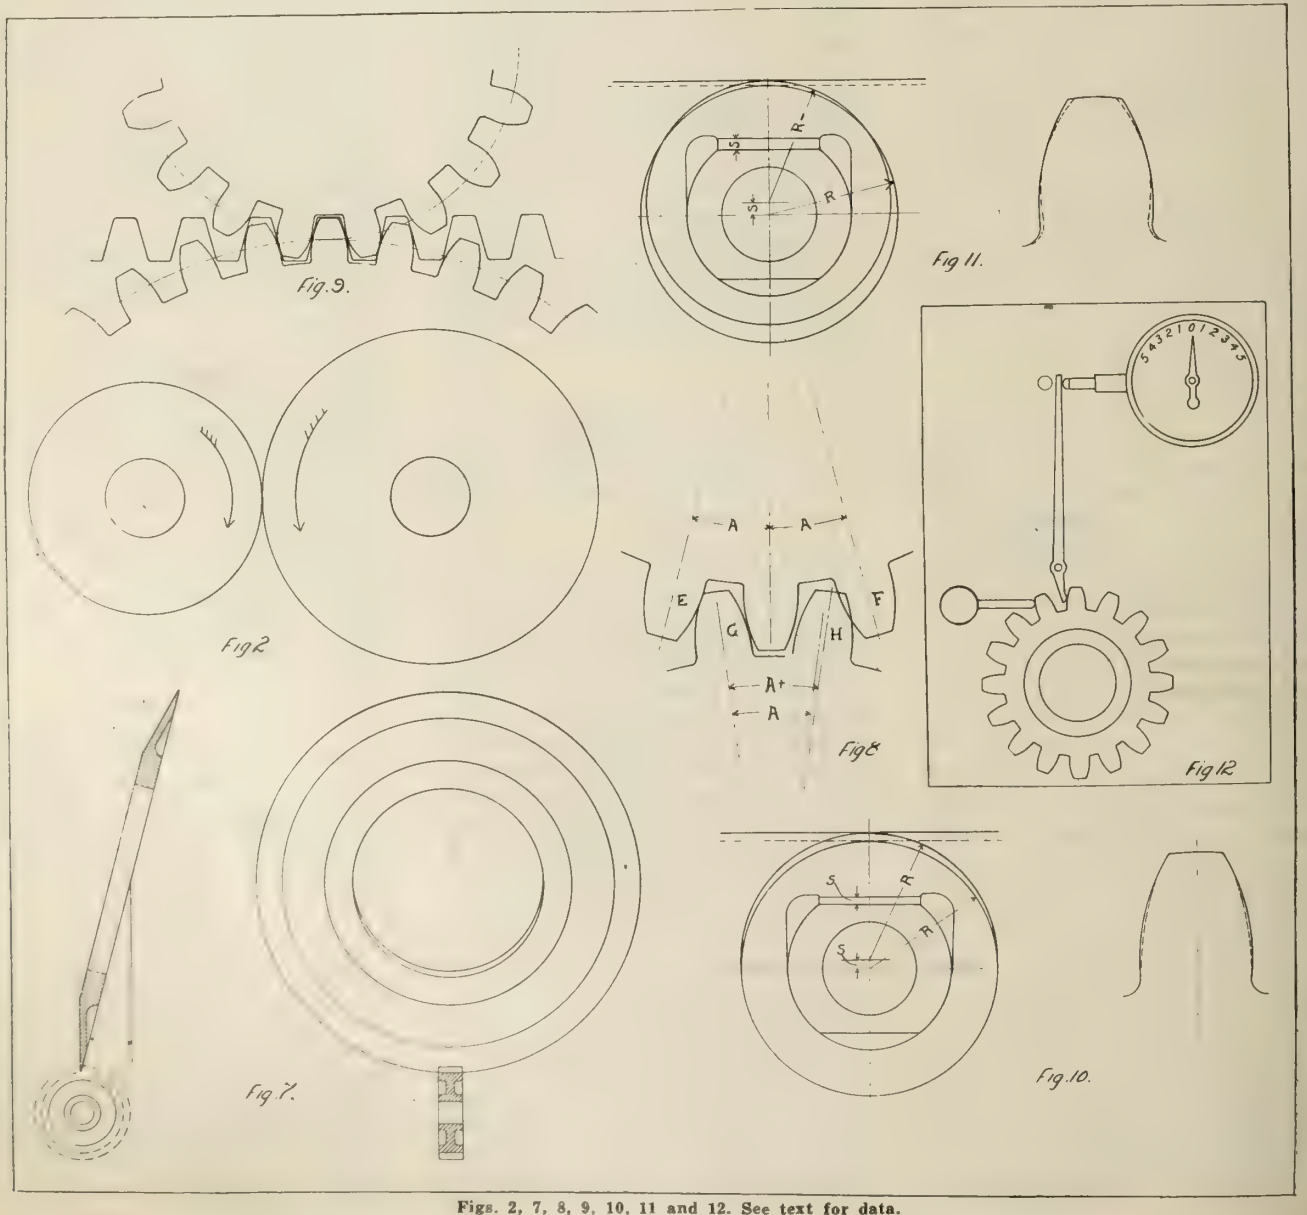
The power is not applied to the work slide but to a sleeve through which the work spindle rotates when indexing. When the machine is grinding, the sleeve and work spindle rotate together as one unit. The sleeve carries the segment to which one end of each of the tapes is fastened. The other ends are fastened to a bracket on the column, accordingly when the sleeve is rotated first in one direction and then in the reversed direction the tapes will wind on and unwind from the segment and thus through their pulling action on the bracket, cause the work slide to reciprocate. This is shown in Fig. 6, and it is very apparent from this diagram that there is a uniform torque load to the work spindle by a worm and wheel whose primary function is to rotate the sleeve in reversed directions, also that there is uniform load on the tapes due to the fact that the frictional resistance of the work slide on the ways is maintained constant by gravity only, and does not depend on a take up by clamps or gibs which might vary in resistance.

The smoothness of the worm wheel driven sleeve and work spindle, and the accurate travel of the work slide are utilized. It is almost inconceivable how easily and accurately these two elements co-operate while the grinding is in operation.

The problem of centering the tool and blank is done away with by the fact that an emery wheel with a plane surface is used when generating, as illustrated at Fig. 7. This plane face also has continuity of action with the profile of the gear tooth, and must not be confused with a cone shaped wheel which necessitates a compound movement of work and tool in two directions, that is, a generating rolling action, and a cross travel to make the small intersection of wheel and profile cover intermittently the width of the tooth.

Operating Machine

The operation of the machine is as follows: A segment equal to the pitch diameter of the gear to be ground is located on the work spindle. The emery wheel is set at the pressure angle of the tooth to be ground. The head carrying the wheel is raised to the correct height so that the wheel will cover the working depth of the tooth. The wheel is dressed using a micrometer adjustment. The wheel is then moved to the starting position by a micrometer handwheel and there are two positive stop pins located in a circular T slot. These are used in conjunction with a positive stop to locate the wheel in a start and finish position. There is also an intermediate spring stop for the roughing cut. The starting stop is usually set to grind .004″ from the tooth.



The gear to be ground is then locked on the work arbor with a tooth in contact with the emery wheel face. The machine is started up and the roughing cut is taken, located by a spring stop usually cutting .003″ from the teeth once around, then the micrometer is fed up. .001″ more to the finish stop being the .004″ allowed for grinding. This brings the wheel back again into the generating plane and the same position in which it was dressed. When the wheel needs to be dressed again, which is usually every other gear, then .0004″ is taken off the face. This is accomplished by an independent feed to the micrometer so that the stops for starting and finishing do not have to be disturbed.

There is a notched disc and a lever pawl, releasing this pawl allows the wheel to be fed up 2/10,000 inch for each notch so that usually two notches are used to bring the wheel against the diamond the average cut of 4/10,000 inch. The indexing of a gear is a very important factor in obtaing quiet running gears. The index plates used are hardened and ground and the error is very slight as the masters from which these plates are ground are made by the Warner & Swasey Co., who are said to have the most accurate indexing machine in existence today.

Fig. 8 shows in diagram from how an incorrectly indexed pair of gears can not mesh correctly. It is very apparent that the teeth G and H can not come correctly into mesh with E and F and must at this point crowd the centres apart and cause an eccentric noise. Poor indexing may be mistaken for eccentricity or incorrect tooth profile, for under the ordinary methods of testing gears such as rolling them together or using spring centres the resultant effect seems to be the same and oftentimes is very misleading.

The accuracy obtained from this gear tooth grinder calls for a different procedure in the testing of the teeth both for profile and spacing, and since a perfect involute can be ground not to vary more than 1/10,000″, it becomes only necessary to know whether the gears are perfect or not. To do this, a profile testing machine such as shown in Fig. 9 is used. The principle of this machine is that a point unwound from a base circle which is concentric with the gear will trace the involute profile of the tooth. Another method of testing the profile is by using the basic principle that a rack will mesh with a gear of any number of teeth of the same pitch this is shown in a diagram form in Fig. 9.

So far it has been assumed that perfect profiles were required, but we all know that gears are not always used in perfect machines with perfect alignment and center distance, or have other inaccuracies, and in this case the gears may have to be modified or in other words the profile changed to suit local conditions. It has been proved that the variation of the profile of the teeth will cause the gears to "whine" or "hum" or "growl", etc. or run quiet if the correct outline required is found. As an example a certain gear may require a perfect involute and the mating gear

Figs. 2, 7, 8, 9, 10, 11 and 12. See text for data.

a modification of 1 to 2 ten thousandths and a variation from these profiles of .0004″ will cause noise. This being so the following method of procedure has been followed with good results. When modified gear teeth are found necessary a charted record may be kept and after testing with the machine they are ground accordingly. Another way is to keep a master gear which by actual running test has proved quiet, then when grinding use this master on the tester first and by inspection notice the reading of the curve and grind to suit the same reading.

In automobile transmission with correct center distances and parallel shafts very little modification is needed judging from the tests made up to the present . As stated before the modification of profile is made by changing the segments as follows: If the segment is made the same diameter as the pitch circle of the gear to be ground and is then raised by shims as described, then the tooth profile will be generated as shown in Fig. 10, modified at the pitch line, and dying out at the top and bottom. If a smaller segment than the pitch circle of the gear to be ground is used and raised up by shims then the profile will be generated as shown at Fig. 11, modified both top and bottom and dying out at the pitch line.

Measuring Gear Teeth

The method of measuring the gear teeth for index is shown at Fig. 12. The gear is placed on the stud and a tooth turned against a positive stop in X and the indicator is set at zero. Now the gear is indicated tooth by tooth and if the reading remains at zero each time the gear is perfect. The errors are recorded plus or minus by the indicator for angular error in 1/10,000″. The surface of the profile of gear teeth is very important and should be of such a nature that any small imperfection in this profile will under load tend to disappear.

When machining the teeth in the blank to allow for grinding, the best outline to make is as shown in Fig. 13. This it will be noticed, shows the finished tooth in solid lines and the allowance for grinding in dotted lines, and by cutting the allowance almost down to nothing at the root of the tooth, also cutting the full depth of tooth allows good clearance for the wheel and a minimum of metal to be ground. A gear hobber is ideal for cutting the teeth as outlined above, because the principle of hobbing uses the same basic involute system by using a rack form of cutter teeth, the same principle as the grinder uses with the plane face, and as a single cut through the blank is sufficient there is a saving of the time of the finish cut and this time can be applied to the grinding time. However, if other types of machines are in use to rough the blank they can be used with the above slight change in the cutter outline to give a profile to allow finish for grinding. The production obtained from this machine with a 24 inch wheel is as follows: Actual grinding time on the in and out movement of gear including indexing to next tooth on a 6 pitch 31 tooth gear is 10 seconds per tooth or a little over five minutes around the gear removing .003″ on the rough grind and .001″ on the finish grind. Total 11 minutes, loading and unloading time 2 minutes, averaging 30 gears per day of 9 hours.

The life of a wheel is as follows: This is an actual report of a wheel used from March 29th, 1921, to May 12th, 1921. Wheel was a Norton 6636 combination grade "K". This was used down to 21-½″ diameter, and ground 1641 sixteen tooth gears twice around each gear, also did some other grinding making the number about 2000 gears and it is estimated has enough life left in it to grind 500 to 800 of the 31 tooth gears, so on an average the wheels will probably grind 2500 gears.

RECOOLING OIL

(Continued from page 39)

pleting the circuit. The quantity of heat absorbed by the cooling water is 257,897 B. t. u. per hr. The quantity of heat given up by the oil is 269,914 B. t.u. per hr., and of this total amount, part is absorbed by the water in the cooler, and the remainder, 12,017 b. t. u. is dissipated by radiation from the surface of the cooler, piping and oil tank. In this installation, the cooling water was purchased at a cost of 30 cents per 1,000 cu. ft. The total cost therefore of cooling the quenching oil per day of 10 hrs. was 31 cents. The dimensions of the cooler in this plant are as follows:—

Overall length 64½ in; oil inlet and outlet diameters 3½ in; water inlet and outlet diameters 2½ in; largest diameter of flanges 60¼ in; distance from back of feet to face of flanges 21 ¼ in; diameter of shell 14 in; and weight of cooler 1,000 lbs.

The heat surrendered by 1 lb. of steel during quenching as for example, from 1,550 deg. to 150 deg. F., can readily be determined by means of Fig. 5. Enter the the vertical axis at the left at 1,550, proceed horizontally to the right to this point intersection with the curve, thence vertically downward to the horizontal axis. The point of intersection with this axis is 256 B. t. u. Likewise, entering the vertical axis at 150 deg. F., and proceeding 1,200 F. a test piece of low carbon as above, the point of intersection with the horizontal axis is 16 B. t. u. 256-16=240 B. t. u., or the heat that is surrendered by 1 lb. of steel during cooling from 1,550 deg. to 150 deg. F., and that must be extracted from the oil by the cooling system. General practice is to specify 1 gallon of oil for every pound of steel quenched per hr.

If we assume a specific heat of oil equal to 0.487 b. t. u. per lb. per 1 deg. F. and a density of 7.25 lbs. per gal. which is correct for Houghton's No. 2 soluble quenching oil, the temperature rise produced in 1 gal. of this oil by 1 lb. of steel heated to 1,550 deg. and quenched to 150 deg.=

$$\frac{240}{1 \times 0.487 \times 7.25} = 68 \text{ deg. F.}$$

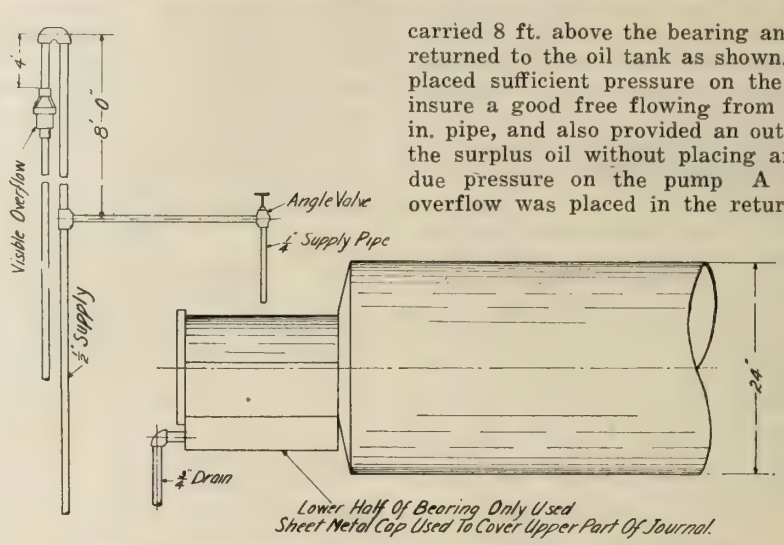
In other words, if the initial temperature of the 1 gal. of oil is 80 deg. F., it will be increased to about 148 deg. F. during the quenching.

If the 3,000 gal. of oil are to be circulated per hr. through the cooler, the oil circulation per min. is 362.5 lbs. If a water-to oil ratio of unity is chosen, that is, if the same weight of oil is circulated per min. through the cooler as weight of water, we can find, by means of Fig. 6, the temperature drop of the oil circulated through the cooler. To do this, enter the horizontal axis at 362.5, proceed vertically upward to the point of intersection with the 1-to-1 ratio curve, then horizontally to the left to the point of intersection with the vertical temperature drop axis. The temperature drop is seen to be about 20.5 deg. F. For 2 to 1, 4 to 1 and 6 to 1 water ratios, the temperature drops are 24, 26.5, and 27.5 deg. F. respectively. Thus, beyond a certain point, increase in the quantity of circulating water does not produce a proportionate temperature drop in the oil.

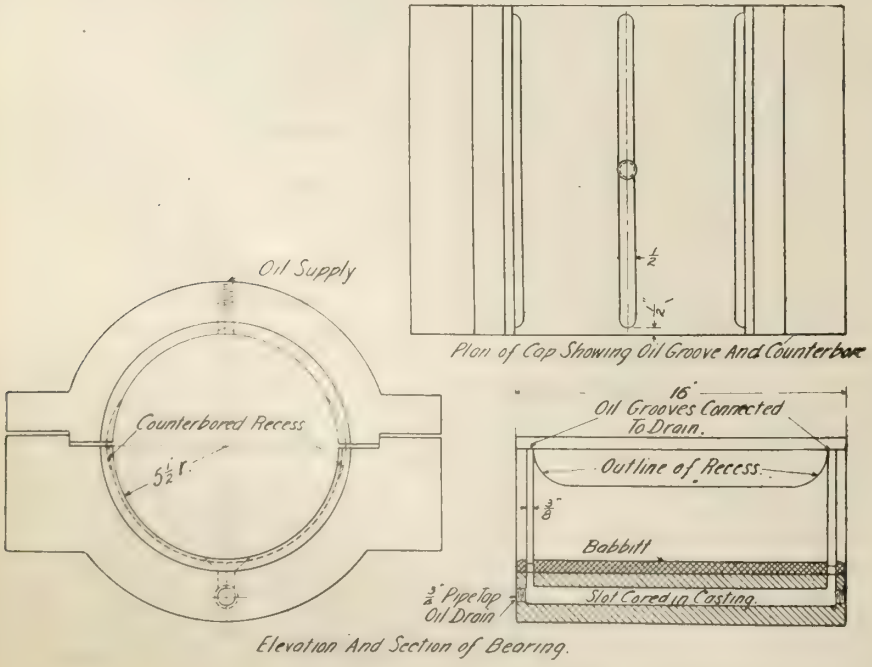
Fig. 7 gives the heat transfer rates (in b. t. u. per hr. per sq. ft. of heating surface per 1 deg. F. mean temperature difference between oil and water), corrected for oil viscosities corresponding to different oil and water velocities expressed in inches per second. For example, given a water velocity of 25.5 in. per sec., and an oil velocity of 24 in. per sec., the viscosity of the oil being 100 Saybolt seconds, the correct heat transfer rate is determined as follows: Enter the horizontal axis of left chart at 25.5, preceed vertically to the curve corresponding to an oil velocity of 24 in. per sec., thence horizontally to the right to the curve corresponding to an oil viscosity of 100 Saybolt seconds, thence vertically downward to the point of intersection on the horizontal axis. This gives 77 b. t. u. as the heat transfer rate corrected for viscosity under the given conditions.

BOLTS AND NUTS

A recent investigation into the fit of commercial bolts and nuts, carried out for the British Engineering Standards Association by the National Physical Laboratory, has shown that a considerable proportion of the tolerances allowed on the effective diameters is virtually absorbed by defects of thread form and pitch. With the quality of thread form at present found in commercial screws, nuts and bolts are not by any means interchangeable, although they may be wholly inside their respective tolerances on effective diameter as measured in the usual way.



WHAT OUR READERS THINK AND DO



SIMPLE METHOD OF LUBRICATING BEARINGS

After experimenting with various types of bearings, the one which I have shown in the sketches accompanying this article proved most successful. This bearing had to endure a dead load of approximately 150 lbs. per sq. in. projected area and a rubbing velocity of about 6 ft. per min. The bearing was also subjected to considerable heat and had to run hot under the best of conditions. The oil ring type of bearing did not prove at all successful as the oil film was continually breaking down to the slow rubbing speed and the comparative high unit pressure for that speed. The result was a metal to metal contact most of the time as the rings running at such a slow speed could not bring up enough oil to renew the film in the bearing.

A plain babbitted water cooled bearing was next tried and, although giving better results as regards wear on the bearing surfaces, it was very wasteful of oil and required considerable attention. The type of bearing shown in the sketch was then designed and proved very successful. It consisted of a plain babbitted bearing with two oil grooves, and a positive, continuous, adjustable oil supply system. The oil reservoir consisted of a tank of about 30 gallons capacity placed far enough below the bearing to allow the oil to drain back into it from the bearing by gravity. A small rotary pump was placed in the oil tank and driven by a chain from a convenient shaft at about 125 R.P.M. A ½ in. supply pipe was used and reduced to ¼ in. over the bearing. This ¼ in. pipe was equipped with an angle valve so that the flow of oil in the bearing could be regulated. The supply pipe was carried 8 ft. above the bearing and then returned to the oil tank as shown. This placed sufficient pressure on the oil to insure a good free flowing from the ¼ in. pipe, and also provided an outlet for the surplus oil without placing any undue pressure on the pump A visible overflow was placed in the return pipe about 4 in. from the upper extremity. This served as an indicator to see if the oil was flowing freely and prevented the oil being siphoned out of the supply pipe thus leaving the bearing without oil. As the load on the bearing was constant and always in the same direction, the upper part of the box was not used and the exposed journal was covered by a special sheet metal cap to keep dust and grit from the oil and rubbing surfaces. The design of the cap intended to have been used is shown in the detail sketch of the complete bearing. The temperature of the oil used in this system rose to about 40 to 50 degrees above the room temperature and remained fairly constant within these limits. A good quality free flowing light machine oil was used and the temperature rise was not sufficient to cause a break down of the oil film due to decreased viscosity resulting from the increase in temperature.

Sketch is self-explanatory. Shows how bearing is lubricated.

Elevation and section of bearing used.

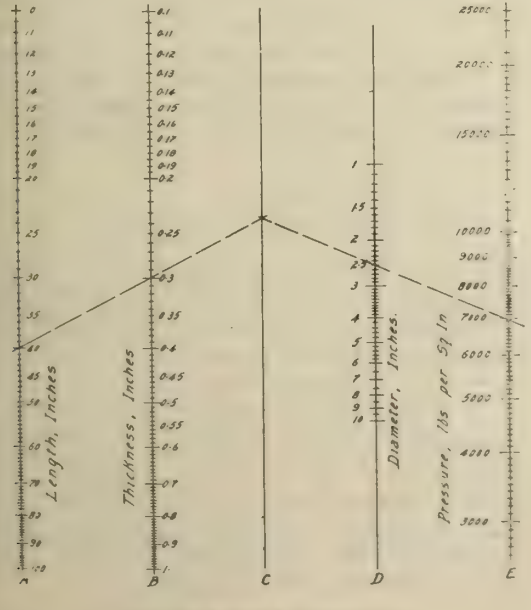
The oil grooving in the bearing was so designed that the oil would be introduced at a point where the forces acting tend to separate the shaft and the box. At this point a groove was cut in the surface of the box so as to distribute the lubricant evenly over the entire surface of the journal. Having been so introduced it was expected that the oil would adhere to the journal and be carried around to the point where it is pressed against the box with the greatest force, thus forming the lubricating film which separates the rubbing surfaces. As few oil grooves as possible were cut. One at the top of the cap to distribute the oil

over the bearing, and one on each side of the lower half of the box to collect the oil, which would otherwise run out of the ends of the bearing, and cause it to flow by gravity into the lower part of the bearing where the oil grooves are connected to the hole in the box and from which it is conducted by a ¾ in. pipe back to the supply tank where it is strained and used over and over again. In order not to have the oil wiped off the journal before it reached the point for which it was intended, the sharp edges of the box were recessed or counterbored as shown in the sketch.

The upper extremity of this counterbore was connected with the oil grooves at the side so that any surplus of oil would flow into these grooves and back to the tank. The oiling system and bearing just described is simple in construction. The oiling is positive in action and can only fail from the pump breaking down or wearing out and a spare pump should always be kept on hand to meet such an emergency. The bearing has given much better service than those of a more complicated type.

Editor's Note—Who wrote this article? We have by some means or other lost the author's name and address.

CHART FOR PIPING



W. F. Schaphorst

The chart shown in the accompany illustration is one which is based on the formula that

$$P = 9{,}600{,}000 \frac{T^{2.18}}{LD}$$

where P=the collapsible pressure in lbs. per sq. in.
T=thickness of metal in inches.
L=length of pipe in inches.
D=outside diameter of pipe in inches.

The chart is intended for solving piping problems without need of calculations, by the simple use of a straight edge as shown by the dotted lines.

This chart should prove useful.

Example — What external pressure will a 2.5 inch pipe safely with stand whose length is 40 inches and the thickness is 0.3 inch?

Run a straight line through 40 (col. A) and the 0.3 (col. B) and locate the intersection on Col. C. From this intersection run a straight line through 2.5 (col. D) and the intersection with col. E gives the result. In this case, 6950 lbs. per sq. in. The chart can be used to obtain any of the other factors by simply reversing the process.

PECULIAR GEAR ARRANGEMENT

In the Oct. 20th issue, we showed an interesting example of gearing, as applied to a "Quilt Stitching Machine." It was not our intention at that time to compare the method of making this gear arrangement, but rather to point out an unusual application.

Mr. Chester B. Hamilton, Jr., of the Hamilton Gear & Machine Co., Toronto, noticed the article and has written us a very interesting letter in which he points out that this work could have been accomplished in a more economical manner by means of a gear cutting machine. As he says, "The gear arrangement is composed of portions of external and internal ring gears, which are connected by tangent racks. The only place where a commercial gear cutting machine would be struck would be on a job involving spiral or progressive curves of changing radius."

This brings up an interesting point, viz, how will further machines of this nature be made? While the present pattern may suffice for a time, the period will come when a decision will have to be made between the cast and machine cut tooth method, and of course there is no question about which would make the most satisfactory job. If gear cutting machine manufacturers care to prove their cost figures, there is no reason why machine methods should not be adopted.

FLOATING REAMER HOLDER

By Harry Moore

The holder shown in sketch will hold four different sizes of reamers with a floating effect which is often so much desired. At the same time it does away with the necessity for drilling the shanks of reamers and driving a pin in each one. Part A is slotted across the face to take the circular holder B, which has four holes drilled in its periphery to take the reamer shanks, and is tapped at the top in the center of each hole for a tightening screw C.

A pin D is driven tight into B, but is a loose fit in the hole A, and, with the width of B, less than the width of slot in A, the reamer is allowed to "float" accommodating itself to any inaccuracy that may be present in the machine. Four shallow holes drilled in line with the tapped holes in B, and a knurled head pin fitting hole in A, serves to keep the holder from flopping about as the turret is turned.

ERRATA

Last week we published an article on "Ball Bearings as Adapted to Grinders." This should have been credited to Gordon Janes, and not Donald A. Hampson. Mr. Janes is manager of the Toronto office of the S. K. F. Ball Bearing Co., and it was through his courtesy that the material was printed.

Several oil manufacturers have contributed samples of their products for experimental material, specimen automobile and tractor motors of different makes and types have been obtained from manufacturers, and the various kinds of oil will be subjected to a practical test in these engines. Before and after the oils are used the chemical engineering department will make various tests to ascertain the physical and chemical qualities, and to determine the relation between the laboratory tests and the actual value of the oil.

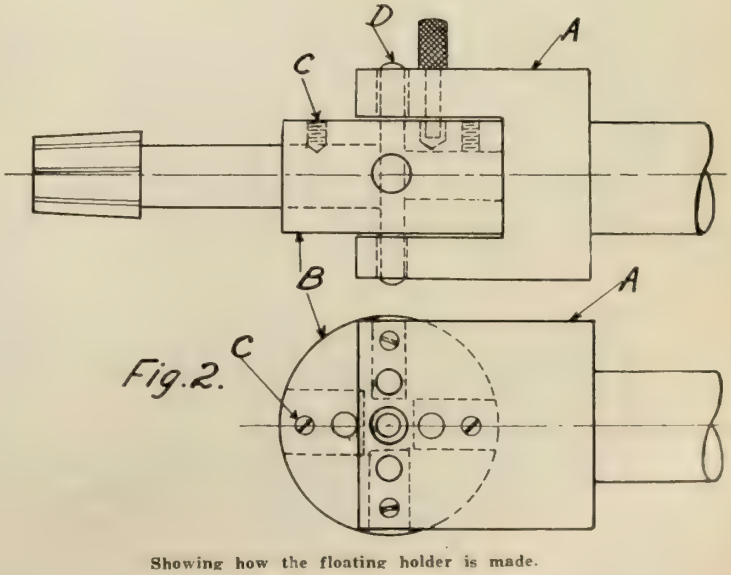


Fig. 2.

Showing how the floating holder is made.

A Novel Departure In Design

A. F. OSTERLIND and F. C. Damn, both of St. Paul, Minn., have replaced the complicated and bulky type-setting machines, which have long been characteristic features of the modern printing plant, with a machine that startles one with its absolute simplicity. We learn, says "Scientific American," that the two inventors had been working along the same general lines for many years, but it only required the meeting of these two minds and the exchanging of their ideas some two years ago to bring about this new conception in type-setting machinery. The new machine is a matrix-setting line-casting device, containing many features not heretofore attained by other machines of like nature, so claim the inventors. The line is assembled the same, but when assembled the operator touches a key and the line automatically passes directly into the jaw, in position for casting. Each line is followed by a master matrix which holds the succeeding line. There is no elevator to wait for, nor are there any return stops or springs, all of these annoying features being discarded entirely, and the line when cast is ejected by means of the liner which is a part of the mold. The length of the line is determined by a dial that can be set in less time than it takes to tell it—varying from 2 ems to 38 ems in length, and from 5 point to 42 point in thickness. The machine especially intended for the large display types of advertising composition, has a range from 42 point to 102 point.

The magazines, of which there are six, are shifted to position simply by operating the small lever up or down, the movement being about one inch for each change. There are no cranks or wheels to turn—each movement is positive and accurate and made instantly.

The metal pot holds 100 pounds of metal. The well is separate from the main pot, though heated by the same flame. The mouthpiece and throat are easily accessible by means of a very ingenious method, making cleaning a matter of minutes rather than hours and no special saws, brushes, drills or tools are necessary. The slugs cast by the machine are solid top and bottom, supported in the center by a solid support. The new machine is claimed to be unequalled in the matter of speed, due to the simplified mechanism. Only one-half as many parts are needed in this design, as compared with the usual type-setting machines.

The True Value of Work

SPEAKING ON "Work" the college paper, "The Varsity," gets away with these choice and true remarks:

After all, why should we work? Why spoil one's College course by going to lectures, and by plugging hour after hour at the writings of men who are dead and gone—we know where we should have sent them—when there are so many othr activities that claim one's attention and interest? What's the use of it, when we know that a kind-hearted Providence has endowed one with brains enough to get over the year's work in the last six weeks and still get a very respectable third, or even a second? How often we reason thus, not so much at this time of year as later in the session. How ready we are to accept the old interpretation of the Genesis story and believe that Work was sent as a punishment for man's sin and that Heaven is a state of rest in which our tasks are all done and done with. It is well that at the outset of our year we should realize the fallacy of this view of Work. The Pauline dictum, "Let this be known among you, that if any man will not work neither shall he eat," is not only sound theology, but is also sound economics. Work is not an imposition, but a duty and a privilege, and the man who does not appreciate the fact that without real work his personality cannot gain full play, is indeed unfortunate. It is all right to work for a degree. It is better to work for the knowledge gained, but above all it is good to work for work's sake. The greatest happiness is the knowledge of a congenial and useful task well done and the prospect of another to be done.

Straightening Malleable Castings

TO STRAIGHTEN a malleable casting with the least risk of breakage, comments "Mechanical World," the necessary force should be applied gradually by means of a screw press or other similar arrangement, and the work should always be done cold. If, however, the casting is too short or rigid, it may be heated; but in no case should it be allowed to get more than "blood red," or the nature of the iron will be completely changed; and if it is allowed to reach a bright heat it will be "red-short." After heating and straightening, the casting should be buried in ashes and left to cool down gradually. Neglect of this latter precaution will lead to subsequent trouble in the machine shops, owing to the exterior of the iron becoming chilled and hardened beyond the reach of anything but the finest high-speed tool steel.

Atmospheric Corrosion

THE Committee on Corrosion of Iron and Steel of the American Society for Testing Materials reports that tests which have been in progress for five years in the Pittsburgh district on uncoated metal sheets are nearing completion and have now reached the point where the committee definitely concludes that "copper-bearing metal shows marked superiority in rust-resisting properties as compared to non-copper-bearing metal of substantially the same general composition from which superiority we may truly anticipate a marked increase in the service life of copper-bearing metals under atmospheric exposure of uncoated sheets." Other corrosion tests are being conducted in different parts of the country, and before very long a final report may be expected in which results of importance will be stated.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Several contestants submitted correct answers this week and as there was nobody correct the previous week, two scales are being given for the Oct. 13th list. Following is the way in which the correct lists were eliminated: F. Kane, Lachine, Quebec; John Strain, London, Ont.; L. T. Churchill, Calgary, Alta.; Nelson Ryder, Hamilton; F. L. Walsh, Sydney, N.S.; M. L. Thompson, Kingston, Ont., and J. McCampbell, Thessalon, Ont. The first two names mentioned receive the scales.

CONTEST FOR NOVEMBER 3rd ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1—How to face the bottom of a hole.
2—Something that is oil and grease proof.
3—How to cut and draw at the same time.
4—Something that was originated 29 years ago.
5—How to eliminate certain troubles.
6—Something that overcomes wear.
7—Good advice.
8—Something designed primarily for one purpose, but adaptable to other machines.
9—A product that is completely guarded.
10—Something light, but strong in power.
11—How to get the advantage of 60 years' experience.
12—Something that is properly proportioned.

These are Correct Answers for List from October 13th Issue

1—The Charles Parker Co.
2—The L. S. Starrett Co.
3—Duncan Stewart & Co.
4—Canadian Fairbanks-Morse Co.
5—Crane, Limited.
6—Simonds Canada Saw Co.
7—Nicholson File Co.
8—Northern Electric Co.
9—Oakley Chemical Co.
10—Geometric Tool Co.
11—Bilton Machine Tool Co.
12—Wright Manufacturing Co.

Closing Date for This Contest is Nov. 24th

DEVELOPMENTS IN SHOP EQUIPMENT

STICKING MACHINE

Mr. R. S. Griffith has received the agency for Vickers Limited, London, Eng., and recently opened up a Canadian Sales Office at 371 St. James St., Montreal, and has on exhibition in the warerooms adjoining his office a representative range of book-binding, stitching, and box making machinery, binding machines, cutting, scoring and grooving machines, which save 25 per cent on glue, as well as several small oil engines, and small products of the Vockers plant, such as machine shop small tools, rifles, etc. They have on exhibition the variable feed straight and cross stitching power machine, the fixed feed corner wire stitching machine, and the nailing, stitching, and cleat stitching machine. The variable feed straight and cross stitching machine is provided in two models, one designed exclusively for making up card board boxes, and the other for the printing trade. The former machines use round or flat wire and form stitches parallel to the corner of the box. The mechanism of the machine is mounted in a "T" shaped casting, bolted to the pedestal, one end of the "T" carrying the stitching head and the other the driving gear and pulley. The steel driving shaft is carried in gun metal bearings and transmits the power from the driving gear to the stiching head. A silent one revolution spring clutch is operated between the driving pulley and driving shaft. The pulley runs continuously and is connected to, and disconnected from the driving shaft through the medium of this clutch operated by a foot pedal mounted on the base. This foot pedal is provided with a safety catch to prevent accidental depression and any number of stitches can be taken, that is, one at a time, two at a time, or continuous! Perhaps the point that is the most interesting is the fact that the adjustment for thickness of work is made at a single operation, without the use of a scale or rule or any reference to the thickness of the work in terms of dimensions. Two caliper stops are provided, one fixed on the head casting, and one moving with the top of the anvil. In adjusting the thickness it is only necessary for the operator to place a specimen of the work between these stops and raise or lower the anvil by means of a handscrew until the stop bites the work with an easy grip. The anvil is then clamped in position. With this setting other adjustments are automatically made without thought or action on the part of the operator. The length of wire for the stitch the length of feed for the wire, the length of stroke for the machine, and the timing of the cut-off will all be found correct. Thus, whatever the thickness of the work within the limits of the machine, it will be tightly and securely stitched, the extremities of the wire which go to form the clinch being of constant length for all thicknesses.

No feed wheels are used, the feed being by means of two sliding grippers which ensure a positive feed. The wire is fed around a flat spring guide, which compensates for any slight irregularity in unwinding the spool. The feeding mechanism is operated by a cam movement, the length of stroke being automatically adjusted as mentioned above. Means are provided for throwing the feed mechanism out of gear instantly, so that the machine can be run without wire, to see that all working parts are running correctly. The maximum time is allowed for the feed owing to the fact that the feed for each stitch is taking place while the previous stitch is being driven. Special wire guides are provided to ensure entire reliability in the case of the longer feeds.

All component parts of both stitching and driving mechanisms are made of substantial sections and sizes, to avoid breakdowns. The working surfaces are hardened so that the user of the machine can rely upon long life, and freedom from breakage. The knives and cutting tubes can be repeatedly ground up and easily reset, and thus no part need be discarded until thoroughly worn out. The various operations going to complete the stitch take place in sequence, both in the up and in the down stroke. There is no idle period in the complete cycle. In consequence, the maximum time is given to each function, thereby avoiding harsh and hammerlike action, and also giving a steady and even torque on the driving shaft.

The machine is built to withstand hard work and rough usage, and it is claimed that the chances of breakdown are very slight. All working parts are standardized and numbered, and interchangeable replacements may be obtained from stock by return of post. Though the machine will work smaller sizes than that for which it is built, perfect work cannot be guaranteed if this is done, and owners of machines are therefore recommended to use wire supplied by the manufacturer of the size for which the machine is fitted.

PISTON GRINDING ATTACHMENT

The Norton Company of Worcester. Mass., have just brought out a new universal piston grinding attachment. This is supplied as regular equipment with their autopart regrinding machine, which is a tool designed primarily for automobile regrinding shops. The character of work done by these shops makes it necessary for them to change the set up of their cylindrical grinding machine each time they grind the pistons of a particular make of car. Under these conditions the ordinary fixtures used for quantity production would not be satisfactory. The new device is said to possess the following advantages:-

Universal application.—Can be used on pistons from 2¾" diameter up to the largest tractor pistons 7½" diameter. Set up of fixture for different size pistons can be made in less than two minutes. Ample clearance for the corner of the wheel to travel beyond the end of the piston, without interfering with fixture. Provision for taking up wear, insuring long life. Facilities for proper oiling.

The fixture consists of a dead center upon which revolves a cast iron cone in which have been cut three dove-tail slots. In each of these slots is mounted a hardened tool steel slidable member, the upper surface of which is ground conically. This upper surface is parallel to the bottom of the slot, so that the movement of the jaw is along an element of the cone. In each of these jaws is turned a transverse groove which permits the corner of the wheel to travel beyond the end of the piston, without interference. The jaws are also slotted longitudinally and locked in place by a taper pointed screw

The surface upon which the piston rests being elements of a cone, an accurate setting of the jaws is unnecessary they are merely set by the eye to bring the clearance groove into proper position. The cast iron cone revolves upon the end of a dead center on a conical bearing and is driven by the regular drive pin extending from the face plate of the machine into the cored slot shown. The piston is driven by means of a spline, made of a small piece of sheet steel screwed to the side of one of the jaws. A sha

low slot is filed in the skirt of the piston to engage this spline.

In the case of a DeLuxe piston where the makers do not recommend slotting the skirt, a special driver is furnished, which is adjustable for all sizes of pistons. The bearing of the cast iron cone on the end of the dead center is tapered, wear being taken up by turning a split adjustable threaded collar immediately in back of the cast iron piece. The slidable jaws are of tool steel hardened. Should they become worn they can be dressed by setting the fixture in the adjustable center grinding attachment which comes with the machine. This can be set to the proper angle and the jaws cleaned up. Ample oiling facilities are provided by means of drilled holes leading from the back of the center to the inside of the bearing. The fixture described is known as attachment style No. 509 and is only furnished with Norton autoport regrinding machine.

OPEN SIDE PLANER

The Pollard Mfg. Co., Ltd., of Niagara Falls, Ontario have just brought out a new Open Side Planer of very rugged design. The machine will plane 49" high under the cross rail, and 42" wide with cross rail head set square, and 48" with cross rail head angle. Standard machine will plane 12' 0". The Platen is 40" wide. The final drive to the planer platen is through a steel rack 6" wide bolted to platen, with teeth cut square, (not at an angle) to avoid side thrust on the "V" ways. A quadruple thread spiral gear 8" diameter engages the rack. The spiral gear shaft is driven through bevel gears with a four to one reduction. Driving pulleys are 30" diameter and three inch belts are used. The counter shaft is mounted on the top of the planer frame and operating at 336 r.p.m. gives a cutting speed of 35' 0" diam. The space between platen and post is 8" Power raise and lower for cross rail and side heads. One head on the cross rail and one side head on the post is standard equipment. Two heads can be accommodated on the rail also two side heads if required. The complete machince sits above the floor line, thus no pits are required to set it.

The "V" ways are 4½" wide, 20" centre to centre, provided with oil pockets and automatic oilers. The platen has the attractive feature of being double decked, as it were. All stake holes, either square or round as desired, are in the top plate as also are the four "T" slots which are 10" centre to centre. The bottom plate is solid. Centre cores between the two plates provide for the discharge of chips, none of these chips getting through to the driving mechanism. The post is of rigid construction, securely attached to the machine bed. It is provided with two sets of cross rail ways of generous proportions.

The cross rail is of heavy design. The cross rail heads have automatic feeds in all directions. Side heads have vertical automatic feeds only, hand feed for horizontal motion is over a distance of 12 in. A fast speed friction raise and lower for side heads is provided. A 15 H.P. motor is recommended to drive the machine. The weight of a standard machine to plane 12' 0" long is 28,000 pounds.

WOOD WORKERS VISE

The Oliver Machinery Co., Grand Rapids, Mich., have produced a new type of wood worker's vise with some unusual features. The vise is known as their No. 1 Universal. A pamphlet illustrating the sise shows ten different set ups. Briefly they are, first, the usual conventional vise set up with the jaws horizontal and with horizontal vise screw. It may be here mentioned that the vise screw is in the centre of a pair of rectangular shaped jaws 7¼" wide, 18" long, which will open up to 16". The method of attaching vise to the bench is unique and reflects careful designing. This fixture is of rugged design and lends itself nicely to several universal features contained in this tool. The first set up with jaws horizontal brings the top of the jaws flush with the top of the bench. The second set up shows the vise with vertical jaws extending well above the bench. The third set up shows the jaws horizontal, vise screw vertical, and tilting jaw in place. The lower jaw is the stationary one and is flush with the bench. The position illustrates its adaptability to the use of wedge blocks and clamping angle pieces or other irregular work. The locking bar is flat, not round, and prevents slipping of the vise in any position from 0 degrees to 90 degrees. The fourth, fifth and sixth positions show the versatile features of the vise when taking care of angle pieces. The seventh position shows the main jaws swung around to bring the jaws for holding metal into top position. This is a handy feature for metal patterns. The eighth set up shows method of holding frames and box forms, making use of the tilting feature of the vise. The next set up shows the use of extension dogs in the front and rear jaws holding rectangular work. By using four dogs, two in each jaw, round work can be clamped on top of the jaws. The screw is steel 1-1-8" diameter, with buttress thread. The nut is self centering and detachable, being easily replaced. The beam on bar is so constructed that metal filings or other injurious matter cannot fall from the jaws above, on the screw, and wear the threads unduly.

NEW LINE OF GRINDERS

The Sumbling Machinery Co., Ltd., Toronto, Ont., have placed a new type of grinding machine on the market. The machine is for machine shop use in grinding tools, cold chisels, etc. It is an improvement on the earlier type of grinder head. Two grinding wheels are mounted on the ends of the arbor, and sizes up to 12" diameter can be used. Each grinding wheel is protected by a malleable iron guard held by one bolt and handle. In event of breakage the shock is well distributed over the top of machine. The work rests are attached to guards and are adjustable to all positions, "T" handles holding them firmly. A self contained water reservoir forms part of the tray of machine which is mounted on the top of the pedestal frame. Special patented mounting means are incorporated in the design. Details of design such as large self oiling bearings have been given careful attention.
